Jim Webber, president of Omicron, an IS executive user group, says topical meetings are the key to his group's success

User groups strive to survive

By Thomas Hoffman

To get to a user group meeting these days, Rick Zisack would need to clone himself like Michael Keaton's character in the new film *Multiplicity*.

The information systems manager at The Milkraft Paper Co. in Cleveland works

12-hour days as he and his two-person staff struggle to support the 50 users who were added following his firm's recent acquisition of two paper companies.

Zisack, a member of Unisys Corp.'s Unite user group, is lucky if he makes it to one Unite conference per year.

User groups, page 125

Outsourcing cures mobile pains

Companies turn to third parties to rein in support costs

By Mindy Blodgett

The exploding mobile workforce is giving a giant headache to information systems managers already stretched thin by user demands.

To ease the pain, companies are taking two aspirin and calling for outsourcing help in the morning.

"We're definitely considering outsourcing support," said Linwood Walker, senior network engineer at Pfizer, Inc., a pharmaceutical company in New York. Pfizer's head count of remote and mobile workers as well as telecommu-

nisters is 2,000 and growing.

"Staffing a 24-hour help desk is a tremendous cost, and supporting mobile workers calls for different skill sets — it's a dilemma," Walker said. Sarah Samiller, IS manager at the United Jewish Appeal in New York, said her nonprofit organization is also considering outsourcing mobile support.

"I don't want to walk around with a Mobile, page 16

Clash of titans

Microsoft gaining on Netscape in race for 'cyber mind share'

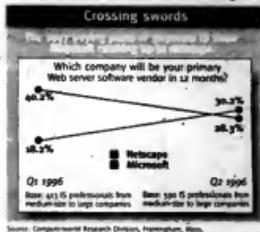

By Kim S. Nash

Microsoft Corp. appears poised to crash Netscape's Internet party.

The PC software company that just six months ago declared itself "hard-core about the Internet" is likely to catch or even overtake Netscape Communications Corp. on the server software front within the next 12 months, according to an exclusive Computerworld Research Division survey of nearly 700 information systems managers.

The poll was financed and conducted solely by Computerworld, Inc.'s research division, which tracks monthly buying patterns in key technology markets at medium-size to large companies. Survey results for the second quarter — from April to June

Clash of titans, page 121

Info-boom fattens paper glut

By April Jacobs

Littered with more virtual and real paper than ever, the road to the paperless office has become the 1990s equivalent of the search for

the Holy Grail.

In their quest to eliminate the great paper clog, users have turned

to workflow, imaging and document management software to handle the stream of documents that flows from electronic mail, printers, the Internet, fax machines and mail servers.

the Association for Information and Image Management International in Silver Spring, Md. "We still have lots of paper, but we have even more electronic documents. So the challenge is being able to manage the information."

A newly released AIM study of 500 information technology professionals showed that 55% of the respondents are considering workflow technology.

"We now have a double-edged sword," said Priscilla Emery, senior vice president of information services at

Virginia Retirement's

June Pugh. "Understand

what your users need."

Paper glut, page 121

Olympian undertaking

OLYMPICS

in cyberspace

In Depth

We'll go first

Change is good. You go first," reads one of my favorite *Dilbert* cards. That tongue-in-cheek blend of truth and humor is, I suspect, why we're all so besotted with Scott Adams' nerdy comic strip creation. It's always more fun to watch the other guy go first.

With that in mind, we're making some changes to *Computerworld* that we hope you'll enjoy. Our alt.ew column, a bright and eclectic collection of technobrivia, is now on our back page with *Inside Lines*, our industry rumor column.

We've also kicked the table of contents off this page to the next one. In its place will be this Editor's Note, a rundown of the latest news items in brief, and Rich Tennant's *The 5th Wave* cartoon.

When you get right down to it, cultivating a sense of humor has to be a key item in today's IS survival kit. For instance, what a riot to realize that years of vendor babbling about the paperless office was all a scam. If anything, there's more paper, both real and electronic, to manage these days (see stories, pages 1 and 69), and a \$3 billion industry has happily created itself just to help out.

To temper our need for IS self-help books, we've added a late-night-and-long-working-weekends section (page #2), you can check out the coping skills of some IS folks who break out trivia games, write silly songs or bring in massage therapists when cramp hits.

Speaking of crunch time, it's arrived with a vengeance for Netscape and Microsoft, as our lead story details. Microsoft is ready to grab big gains in the commercial Web server software market, much to Netscape's dismay. Our research into the 1997 server software buying plans of hundreds of IS professionals predicts a dead heat between the two within a year.

Once the thrashing and moaning about this survey dies down at Netscape, the company may realize this is good information to have. It's a clear heads-up that IS "mind share" is drifting to the rival camp. The power to change that is in their hands.

That's it. Everybody back to work! You go first.

The 5th Wave by Rich Tennant

COMPUTERWORLD JULY 15, 1996 (www.computerworld.com)

AST thins down PC offering

By Justin Hibbard

AST Research, Inc. on Aug. 16 will roll out CentralAN, a multi-user, thin-client system for customers with thin walls. *Computerworld* has learned.

The clients comprise VGA monitors, keyboards and mice that connect through junction boxes to a 166-MHz Pentium-based host PC.

The PC runs a multiuser version of DOS 5.0 as a kernel and four copies of Microsoft Corp.'s Windows for Workgroups 3.11. A

board with multiple VGA controllers inside the PC lets each client display its own Windows session, but the host does the computing.

Lower price, less power

The product is aimed at small businesses, small departments in large corporations, schools and users who don't need the power of a full-blown LAN.

AST hopes those customers will buy CentralAN rather than a server and several PCs that require yearly upgrades. The company hasn't announced a price for

its product, but "low cost is the objective," said Chris Norman, a product manager at AST.

"I see more use for it in our office than in our point-of-sale system," said Colleen Scott, MIS director at Discourt Tire Co. in Scottsdale, Ariz., which has 304 stores throughout the country.

Scott said processing-intensive operations such as sales require the power of a Unix-based client/server system. But for a small administrative staff in one location, a 166-MHz Pentium-based PC could be enough, she said.

News Shorts

Intel cancels price cuts

Chip giant Intel Corp. in Santa Clara, Calif., plans to cancel most of its scheduled November price cuts for its Pentium and other microprocessors. The company believes it is a practice to cut prices every quarter. It is next scheduled to do so in August. Under the new plan, Intel will skip the November cuts and retain summer price drops through February. The decision could dramatically increase revenue and profit for Intel. Lack of competition and a dearth of new products from Intel may have prompted the move, analysts said.

Clarify dials up telecom market

Clarify, Inc. in San Jose, Calif., this week will announce Clear Support Comm Center, an integrated client/server customer service and problem management system for telecommunications companies. The system gives users one point of access for information about customer accounts and the communications network. It costs \$80,000, plus \$3,750 for each client.

Notebooks get new features

Two notebook makers last week announced upgrades in their leading lines. NEC Technologies, Inc., Mountain View, Calif., added features to its Versa 4200 and Versa 2400 series. Digital Equipment Corp. in Maynard, Mass., added features to its HiNote VP and HiNote Ultra II models.

Health data online

Johns Hopkins University and U.S. Healthcare, Inc. have launched IntelHealth, a consumer health care company that will provide online multimedia health

care information. The health-care service will be provided by *Intersys Information Technologies, Inc.*, database to deliver information to consumers.

HP drops disk drives

Hewlett-Packard Co. last week said order growth slowed across many product lines and most geographic regions in the first two months of its third fiscal quarter, which ends July 31. The usually high-flying firm will close its disk drive business, which is headed for a \$200 million loss this year. The division is having problems with a new 8.75-GB drive. HP also announced it would cut prices by up to 30% on its low-end Declase and midrange K-class HP-9000 Unix servers. This sets the stage for a promised September introduction of servers based on HP's 64-bit PA-8000 microprocessor.

IBM upgrades middleware line

IBM last week announced enhanced middleware products, including a \$3,000 version of DataJoiner, which now links databases from Informix Software, Inc., Sybase, Inc., Oracle Corp., Microsoft Corp. and IBM's DB2. IBM also unveiled a Windows NT version of its data replication product, DataPropagator, which costs \$975.

Compaq adds desktops

Compaq Computer Corp. this week will unveil its line of consumer desktop PCs. A line of con-

sumer PCs will be released next week. The consumer line of Preseries will include advanced graphics and high-speed memory. With its new Preseries PCs, Compaq will eliminate its Prolinea line and combine all the desktops under the Desktop brand. The Desktops will include additional systems management features, with prices ranging from \$1,400 to \$4,000.

Corel sweetens office suite

Corel Corp. last week announced it will add a project management package to the Corel Office Professional 7 suite. The product, Corel Time Line, is based on a popular Windows project management application from Time Line Solutions Corp.

Another one bites the dust

SCO, Inc. in Santa Cruz, Calif., will pull the plug on UnixWare Technology Group, Inc. (UTG), a vendor consortium that functioned as a marketing group for the UnixWare operating system. SCO assumed the lead role in UTG when it bought UnixWare and the Unix source code from Novell, Inc., last year.

SHORT TAKES Compaq Systems and Unisys Corp. have agreed to provide joint support for midlevel desktop and server systems... Unisys has won a three-year, \$116 million contract from BT to install BT's structured cabling for business customers... Lotus Development Corp. will gain another public Notes network next month when Japan's Nippon Telephone and Telegraph kicks off its Network Application Services by Notes.

IS YOUR BACKUP TOUGH ENOUGH FOR THE JOB?

Is your critical data guarded by a puny backup solution that doesn't scale up? Backup Express™, new from Syncsort, is fast and powerful, designed specifically for today's distributed networks, where the data grows every day. Backup Express™ backs up and restores gigabytes of data fast—whether on UNIX, NetWare, or Windows NT. If you want a backup strong enough to keep your network data secure and bring it back fast, call us.

Point, Counterpoint
Users' complaints with Version 4.1 of
OpenView Network Node Manager

COMPLAINT

We need integrated tools for managing hubs, routers and other functions to support the distributed architecture.

We need a cheaper and simpler Windows NT platform to spread management services throughout large networks.

Half to three-fourths of our partners should be upgrading their software by year's end.

Look for a functional equivalent this fall, but it may handle only smaller domains.

Tools needed for OpenView

By Patrick Dryden

Some users of OpenView, the leading network management platform, worry that migrating to the new distributed version will take too long and that it may not handle their far-flung networks.

Hewlett-Packard Co. delivered the much-delayed distributed architecture for OpenView's Network Node Manager with Version 4.1 on Aug. 1.

This software has had links to many independent management servers, so users can shrink unneeded central databases and reduce traffic load.

But users desperately seeking distributed network management complained that they can't make the change because of the slow pace of OpenView support from third-party vendors.

Chevron Information Technology Co. is eager to distribute network management services across servers in 12 regions. But that requires other vendors to upgrade their software for managing hubs, routers and network events so that these tools will integrate with the new OpenView.

"We're praying we get our key application ported as soon as possible. OpenView itself is maxed out now, and adding these tools brings the server to its knees," said Al Heckrath, operations automation specialist in San Ramon, Calif.

Eli Lilly & Co. in Indianapolis has only one server running Version 4.1 while it waits for other critical applications to arrive, said Tom Reimel, telecommunications analyst at the drug company.

"We can't move our entire OpenView platform until all dependencies are covered, too," Reimel said.

Help will begin to appear this week.

Seagate Enterprise Management Software, Inc. of Cupertino, Calif., will ship Version 2.6 of its NetViewCenter event correlation software, which specifically handles a distributed OpenView configuration.

But other key applications won't arrive until the fourth quarter, according to HP officials and analysts.

Some users questioned whether distributed OpenView can handle the management demands of very large networks.

OpenView "was not as successful as we would like" for handling a network of 15,000 connections

across four campuses at Arizona State University in Tempe, said Joe Atkins, director of data communications at the school. As a result, the university switched to the already-distributed Spectrum platform from Cabletron Systems, Inc. in Rochester, N.H.

Along wait

Dallas-based J. C. Penney Co. waited a year and a half to start using OpenView. It had planned to use cheaper and simpler Windows NT servers from Microsoft Corp. instead of Unix servers. But the prototype Windows NT version doesn't appear powerful enough for four regional centers that must each handle more than 1,200 nodes, said Blaine Bowtell, senior systems analyst at J. C. Penney.

HP officials claim the new platform will function exactly as the familiar Unix version does. But they have tested it by managing domains in the 500- to 750-node range only.

Frontier pushes the boundaries of WAN management
See page 63.

'Zapping' the barriers to C++

Visual development tool vendor takes on Java and Microsoft

By Frank Hayes

Facing the twin juggernauts of Java and Microsoft Corp. in its arduous pursuit of corporate developers, Rogue Wave Software, Inc. this week will roll out a new release of Zapp, its C++-based cross-platform visual development system.

Zapp 3.0 runs on Windows, OS/2 and popular versions of Unix. It costs \$1,995. Users who have tested the system said the new version beefs up Zapp's drag-and-drop development environment and adds a set of visual controls and C++ classes.

But Zapp's strong selling lies in how the visual development environment is tied to Zapp's C++ libraries, customers said. "It saves me 20% to 30% of the coding I would have to do in any of the other application frameworks," said Craig Kendall, a senior software engineer at Mark IV Audio, Inc. in Oklahoma City.

Corporate developers come to Zapp from C++, citing the difficulty of writing and maintaining C++ code. Zapp helps reduce those burdens, Kendall said.

Zapp also generates applications that maintain the appropriate look and feel for Windows, OS/2 and Unix platforms.

tain the appropriate look and feel for each supported platform, said Ken Whitaker, vice president of development at U.S. Data Corp. in Richardson, Texas. "With some of the other cross-platform environments, you can have a Windows application that sort of looks [like Unix], and that's wrong. Users won't accept that," Whitaker said.

Good combo
The new version of Zapp adds its C++ libraries to Rogue Wave's widely used tools.h++ code libraries. The combination was designed to be easy to use and complete enough for corporate developers, according to officials at the Corvallis, Ore., company.

But Zapp faces challenges from Microsoft's Visual C++ and Sun

Microsystems, Inc.'s Java Internet development language.

Visual C++'s Microsoft Foundation Classes framework is popular among software vendors, although as few as 5% of corporate developers use it, company officials said. Microsoft next week will announce a new version of C++ at its Visual C++ Developers Conference [CW, July 8]. It will be aimed at corporate use.

Other vendors are also building more corporate-friendly C++ development systems. They include Borland International, Inc. and Powersoft Corp. And Java, which has gained fame as an Internet-oriented development system, also is being tested as a language for cross-platform corporate developers.

But in the end, Zapp's advantage is that it lets developers dodge many of the problems of C++, users said.

"You don't really need to know a whole lot," Kendall said. "If you come from the [Microsoft] Visual Basic or [Borland Delphi] world, you can just 'Zapp' it off to C++ and design it and then hand it off to a C++ programmer to put the internals in. It's a great prototyping tool."

Zapp generates C++ applications with the appropriate look and feel for Windows, OS/2 and Unix platforms

'net provider takes ATM plunge

By Mitch Wagner

Netcom On-Line Communication Services, Inc. last week said it has completed a major upgrade to Asynchronous Transfer Mode (ATM) for networking hubs in 11 cities.

The San Jose, Calif., company, one of the largest Internet service providers in the country, said the upgrade will result in faster performance and quicker recovery from network failures. Cities involved in the upgrade — which took six months to complete — include San Jose, Los Angeles, Chicago, Dallas and Washington. Before the switch, Netcom used a backbone of T1 and T3 trunks to connect the switches, Netcom used a backbone of T1 and T3 trunks to connect the cities.

"I think it's smart," said Ken Haug, CEO of 1-800-Batteries, which uses Netcom for Internet connectivity. "With ATM, you'll get faster throughput, and hopefully, it'll boost response times when people log in to our site."

The ATM upgrade will benefit all Internet users, not just Netcom customers, said Kimberly Lorenzen, an analyst at The Yankee Group in Boston.

Almost 100 U.S. traffic on the Internet eventually travels over at least one of eight big backbone networks, including Netcom's, she said. Others are maintained by AT&T Corp., MCI Communications Corp. and specialty Internet service providers such as UUNet Technologies, Inc. and BBN Planet. MCI and BT plan to launch a multinational ATM Internet backbone in October.

Points of entry

One benefit of the ATM architecture is that it creates more connections between points on the network. That means signals have a shorter physical distance to travel, allowing the network to react more quickly. And if a point on the network goes down, there are more options for routing sig-

nals around it.

Netcom's upgrade comes as it tries to sign up more business users. It has 400,000 users, including large businesses such as the Frito-Lay unit of PepsiCo, Inc., with 50,000 users, and 85 billion Wells Fargo & Co. But the majority of Netcom's business users have 15 to 1,000 employees, company officials said.

Netcom will soon offer security services and sell甩down accounts to businesses that want to provide connectivity to mobile workers.

The company wouldn't disclose the cost of the ATM upgrade, which comes on the heels of a 13-hour network crash last month.

Benjamin Sick, vice president and general manager of the Network and Business Services group, said that since the crash, the company has established procedures to prevent a similar outage from occurring, but he wouldn't give details. The ATM upgrade isn't one of those procedures, he said.

Oracle: #1 in OLAP, too.

In technology, market share and every other important measure, Oracle is the leader among open database vendors. And now that is true in OLAP too.

Intel moves to reduce cost of PC ownership

By Bob Francis

Intel Corp. — no stranger to cutting prices — is embarking on an initiative to reduce the total cost of owning a PC.

In the next few weeks, Intel will announce a series of seminars and new prod-

ucts to help corporations cut the cost of items such as software, support and administrative services.

Intel's motivation isn't entirely altruistic, said John Dunkle, president of Workgroup Strategic Services, Inc., a consulting group in Portsmouth, N.H.

"In order to demonstrate that you can use these PCs and servers like Intel says you can, they have to show IS managers that [the machines] can be managed," he said.

Intel's push to lower PC life-cycle costs is also a move to fight the perception

that a network computer device attached to the Internet is cheaper and easier to manage.

At a starting price of \$800 and with preloaded software, the network computer looks like a simple solution, said Paul Otellini, executive vice president at Intel.

"However, [the network computer device's] flexibility is extremely limited when compared with a PC," Otellini said.

"Intel has to fight the perception that this \$800 gadget is a network computer device will do everything a \$2,000 PC will do," said James Poyner, an analyst at Oppenheimer & Co., a brokerage in New York.

Intel officials estimate that a standard Pentium-based PC that runs Windows 3.1 costs an average of \$9,324 annually. Gartner Group, Inc. in Stamford, Conn., puts that figure at about \$12,000.

Fifty-six percent of that cost covers end-user operations, which includes learning, application development, training and data management.

Technical support accounts for 15%. Another 15% comes from capital costs and the remaining 14% from administration.

More bang for the buck

Intel argues that its Pentium Pro/Windows NT systems are cheaper in the long run because those systems generally have better Desktop Management Interface (DMI) and plug and play support.

They also boast easy-to-use, new technologies such as Universal Serial Bus, according to Intel officials.

Those technologies give PC managers more tools to manage PC costs.

For instance, with plug and play, network cards automatically configure themselves to a user's system. This cuts down on the need for additional administrative support.

The DMI specification lets systems and network managers monitor desktop PCs, which can give the help desk fast, reliable information about a user's system, said Cheryl Currid, president of Currid Consulting, Inc., in Houston.

For instance, if the help desk knows what software and components are on a user's PC, problems can be resolved faster and more easily, she said.

Other PC companies, such as Compaq Computer Corp. in Houston, also plan to emphasize desktop PC management in their products.

Compaq's Intelligent Management Agent management software will be added to the line of DeskPro systems the company will announce shortly.

Previously, Compaq had included the asset management software only in its high-end products.

"I have better ways for my staff to spend their time than keeping our network up and running ... that's NETSOLVE'S job."

*"I chose NETSOLVE to make sure our wide area network is available when we need it. They gave us a service level **GUARANTEE**, router-to-router, or my money back. It's virtually **BUG-FREE**. In fact, most months my network **UNAVAILABILITY** is greater than **0.0%**."*

At NetSolve, our business is wide area network design, implementation, monitoring and management. It has been for over eight years. Whether your network has 5 remote locations or 500, we'll keep it running reliably, so that you and your staff can focus on more strategic issues.

Keeping a network up and running takes experience, expertise and a strong commitment to service—a commitment that led NetSolve to pioneer the route-to-router availability guarantee. If we don't meet the guaranteed availability level in any month we refund 100% of your management fees for that month!

It's this commitment to service that caused leading companies like Standard Insurance Company, Temple-Inland Forest Products Company, and Fidelity National Title to choose NetSolve to manage their networks.

Call us today for a free evaluation and consultation.

IBM unit makes strides in suites market via bundling deals

By Lisa Piscarillie

Although Lotus Development Corp. remains a distant No. 2 in the suite market, the software developer is slowly gaining ground on market leader Microsoft Corp.

The momentum stems from

IBM's acquisition of Lotus and Lotus' ability to leverage the popularity of Notes, plus a spate of deals to bundle Lotus' SmartSuite with PC systems and printers.

Lotus' share of the suite market jumped to 20.1% in the first quarter of this year, compared with 13% for the same period last year and 15.4% for the fourth quarter of 1995, according to a report by Dataquest in San Jose, Calif.

Lotus, in Cambridge, Mass., attributes the increase to a three-pronged push that includes a 40% increase in its advertising budget, aggressive bundling deals with PC vendors and initiatives to com-

pete users to SmartSuite.

"Originally, we expected to reach 20% worldwide unit market share by the end of 1996, so we are three quarters ahead of schedule," said Lynn Capozzi, senior director of marketing for SmartSuite.

Err on the side of caution

Yet the author of the Dataquest report cautions against reading too much into that Lotus increase.

"Shipment shifts that include a significant OEM component can be misleading if all they reflect in the shipment of software to an end user at no cost and [with] no confirmed intent to use," said Chris Le Toeg, an analyst at Dataquest. But even if the usage isn't as large as the figures indicate, "Lotus' strategy is a success."

Some observers still question how effective bundling deals are. "The long-range impact of

these bundling deals contributes nothing to the long-term market share because the conversion rate for bundled software is negligible," said Jeff Tarter, editor of "SoftLetter," a newsletter in Waltham, Mass. "I'm hard-pressed to think of any company that ever converted bundled software to a solid revenue stream."

Last week, Lotus announced that SmartSuite will be bundled with Fujitsu America, Inc.'s three new lines of laptop PCs as well as with the Proteva line of PCs sold on the Home Shopping Network.

Lotus has bundling agreements with the Acer Group, IBM PC Co., AST Research, Inc. and Epsilon America, Inc., where SmartSuite is preloaded on specific product lines.

Capozzi said she expects that by year's end, Lotus will have bundled 8.5 million units of SmartSuite 96 since the suite's introduc-

tion in November 1995.

Lotus also unveiled a Smart-

Suite Business Partner Campaign

that includes a program for third-

party Notes developers to offer

consulting services, SmartSuite

add-on packages and better inte-

gration with Notes.

One user said better Notes inte-

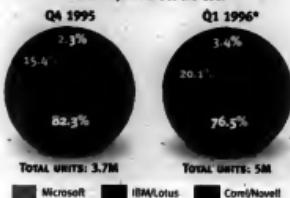

gration is very appealing.

"Notes is a driving force in our organization, and better integration with SmartSuite will be a real plus for us," said Carolyn Spachter, a consulting analyst at the National Council on Compensation Insurance, Inc. in Boca Raton, Fla.

Project management moves along. See page 51.

NCR, Informix guarantee delivery of NT, Unix apps

By Jayakumar Vijayan

Under a deal announced last week, NCR Corp. and Informix Software, Inc. are guaranteeing the availability of some Windows NT and Unix applications.

Similar guarantees are fairly standard in contracts for high-end proprietary systems. But this is the first time a vendor is providing this level of promise in the Unix and NT application world, analysts said.

Here's the promise: If for any reason application availability falls below the level that had been jointly set by the customer and the vendor, the two vendors will provide — free of cost to the customer — the required software, hardware and support to bring the application back to guaranteed levels.

Typically, NCR will guarantee 99.9% availability, though that number might vary in some cases, said Mike Denny, vice president of NCR's computer services group.

Initially, the guarantee extends to integrated NCR Workmark servers running Informix's Online Extended Parallel Server

Highlights of the NCR/Informix alliance

High-availability transaction-processing program: The companies will integrate their hardware and software products with application software from third parties.

High-availability and Informix services practice: Consulting service for custom design, integration and optimization of high-availability platforms

Long-term joint development: Focus on R&D, sales and services

and Online Dynamic Server and pretested third-party applications from PeopleSoft, Inc.

Under the arrangement, the high-availability program will initially target human resources, financial, manufacturing and distribution applications in Windows

— NT and Unix environments.

Some proprietary vendors, such as Strategic Computer, Inc. and Tandem Computers, Inc., offer similar performance guarantees in their service contracts with individual customers. Other vendors, including NCR, have offered similar performance guarantees on an individual basis, and most have been limited to hardware alone.

The deal "sets these vendors a

notch higher than the rest" in the high-availability area, said Gene Lee, an analyst at International Data Corp. in Framingham, Mass. "It's a statement of their willingness to stand behind their products."

Users seeking to migrate mission-critical applications to client/server platforms have been demanding these kinds of performance and reliability guarantees for some time now, said Donna Scott, research director at Gartner Grup, Inc. in Stamford, Conn.

Although technologies such as clustering, for instance, are bringing increasing levels of high availability to hardware, the NCR/Informix announcement is the first to extend systemwide high-availability guarantees, she said.

Although technologies such as

Informix database gets powerful boost

By Dan Richman

Informix Software, Inc. at its user conference last week announced the most powerful implementation of its relational database management system.

Version 8.1 of Extended Parallel Server (XPS) from the Menlo Park, Calif., company spreads all RDBMS functions — including loading, updating, querying and transaction processing — across two or more linked symmetrical multiprocessing (SMP) machines. The arrangement is called clustering.

XPS also works with massively parallel processing machines. OnLine, the company's former top-end offering, only spread functions across multiple processors in a single SMP machine.

Equal responsibility
The approach taken by XPS means "less dependence on a single processing 'basket' that could break at any time," said V. Jane Garske, MIS director at Sun Country Airlines in Menlo Park, Calif.

XPS can also handle large databases efficiently, said Don Upton, a database administrator at MCI

Communications Corp. in Colorado Springs. At that beta site, XPS takes 70 minutes to join three tables of telephone-solicitation records, averaging about 200 million rows. The product turns out a 350-million-row result set that marketers can analyze for trends, he said.

That procedure would have taken IBM's DB2 a week and OnLine at least 10 times as long, Upton said. The increased efficiency means the database can be enhanced with additional demographic information, he said.

"XPS is a very good technology, putting Informix into a battle with Oracle for the most capable parallel technology," said Dan Kusnetzky, an analyst at International Data Corp. in Framingham, Mass.

Version 8.1 has been available for the past year only to select customers and then only on IBM's RS/6000/SP machines. It will be generally available by Aug. 1 for NCR Corp.'s WorldMark \$100, ICL Corp.'s Goldrush MegaServer and Hitachi Data Systems Corp.'s SP490. Versions for nine additional platforms will be announced by Nov. 1. Pricing starts at \$30,000.

Data replication takes off. See page 51.

Any company can say they
offer great middleware.

Only one can say it
offers the number one.

Intel chips in with Internet products

By Bob Francis

Intel Corp. doesn't want its processors left out of the World Wide Web craze.

Santa Clara, Calif.-based Intel is expected to announce a new line of Internet computers and alliances to keep at the forefront of Internet technology. The chip maker will make the announcement July 24 at its Internet, Media Symposium on held in Santa Clara.

Pushing the PCs

Intel's MMX processors were designed to make multimedia a standard feature on most PCs.

Intel hopes to define any momentum behind the network computing device, which uses low-power processors to access Internet applications. Intel's message is that Internet applications require more processing power and local disk drives to be effective.

The vendor will emphasize the following technologies:

- Support for developing "hybrid applications," which deliver interactive content — such as a news feed — from Web pages. More complex content is delivered from information stored on the PC's hard disk drive or CD-ROM drive.

MMX technology, which is Intel's multimedia-ready version of the Pentium and Pentium Pro chips that will arrive later this year.

Support for video streaming over the Internet. Video streaming allows a video signal to come through a standard telephone line in to a PC application with little or no signal degradation.

Intel is betting on better compression algorithms and other technologies to speed data transfers over the Internet.

The company said standard phone lines will be the most common way for users to access the Internet, not cable modems.

Cable modems won't have a big impact on the market until at least the end of the century, said Frank Gill, executive vice president at Intel.

Users said they will need some of these tools soon. "Expect we'll see more Internet technologies in our applications soon, and we'll need tools to do that," said Simon Tufague, a network administrator at New York University.

Analysts said Intel's goal is to retain market leadership as Internet applications become more important to users.

An old technology returns for the 'Net. See page 61.

Double occupancy

Hyatt outsources information technology functions to CSC/Sabre

By Frank Hayes

Hyatt International Corp. last week said it has outsourced its information technology operations to a joint venture between Computer Sciences Corp. (CSC) and AMR Corp.'s Sabre Decision Technologies division.

The five-year, \$72 million deal was signed June 30 and takes effect Aug. 1. The deal will split Hyatt's 140-member information systems staff between CSC and Sabre. No jobs will be lost in the transition, officials from both companies said.

"It's not a traditional outsourcing deal," said John Byrne, vice president for hospitality systems at Sabre. "Hyatt's interests

weren't to cut costs, and they were very happy with the technology that was being delivered."

Instead, the hotel chain hopes to commercialize the Unix-based reservations software it has developed since 1990, said Brett Cornell, director of development at Hyatt's Registry Systems Solutions subsidiary in Oak Brook, Ill.

Personnel shift

Sabre will absorb 46 Hyatt developers and marketing staff and use them as the core for a new division to develop and sell software for hotels and other hospitality companies, said Victor Vassaver,

assistant vice president at Registry Systems Solutions.

Hyatt's operations staff will be employees of CSC, which will handle systems management for the hotel chain's reservations system.

Hyatt's reservations software gained attention in August 1990 when the company switched overnight from a mainframe-based reservations system to one based on a cluster of Unix servers.

The hotel chain tried to sell the software to other hotel companies but found resistance against buying software from a direct competitor. The new arrangement should make it easier to market the software, Vassaver said.

Outsourcing

Apple speeds CHRP support

By Lisa Piscarille

Apple Computer, Inc. later this month will release an alpha version of its Macintosh operating system that supports the Common Hardware Reference Platform (CHRP), co-developed by Apple and PowerPC chip partner IBM. Computer world has learned.

It was anticipated that Macintosh users who were contemplating a move to CHRP would have to wait until next summer, when Apple delivers Copland, its next-generation operating system.

But sources say Apple is rush-

ing to release an alpha version of the CHRP-enabled Mac OS to hardware and software developers this month so it won't fall behind IBM and several Macintosh clone makers that are preparing to deliver PowerPC-based CHRP machines in the second half of this year.

Slow to market

Apple originally had intended that Copland — now called Mac OS 8 — would be its CHRP operating system.

But Copland has met with several delays and won't be available until next summer. Because of its recent financial troubles, de-

clining market share and its status as a key PowerPC proponent, Apple can't afford to let out when the first wave of CHRP computers hits the streets, observers said.

Those machines were designed to run multiple operating systems, including IBM's AIX, Mac OS, Sun Microsystems' Solaris, Microsoft Corp.'s Windows NT and Novell, Inc.'s NetWare.

Apple is expected in the fourth quarter to deliver the final version of the Mac OS 8 CHRP, according to sources. Officials at the Cupertino, Calif., computer maker declined to comment.

D&B Software gives mainframe client/server feel

By Julie King

Dan & Bradstreet Software is offering the look, feel and some of the flexibility of client/server applications to users of its mainframe software.

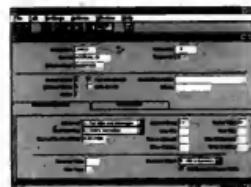

Last week, the Atlanta vendor announced its SmartStream CoHost application, client-based software that gives users Windows-like access to D&B Software's M and E series General Ledger applications. The cost is \$10,000, plus \$395 per user.

"CoHost is an out-of-the-box application that customers can install on end users' desktops, and the next time they sign on, they'll have a graphical look and feel to host applications," said Randy Pil-

lenton, a D&B Software product director. "There is nothing that needs to be done to the mainframe to make this work. Users get all the same security they have now."

Can be customized
Developed in Powersoft Corp.'s PowerBuilder, the CoHost application can be customized to individual users' requirements.

The application also incorporates middleware technology that lets users access and integrate data concurrently from several sources. Using software tools that come

SmartStream CoHost will let users build interfaces to other client/server applications from D&B Software and other vendors.

with CoHost, users can also build CoHost interfaces to client/server applications from D&B Software and other vendors.

Software and other vendors.

"In the CoHost environment, we can streamline screens so users read only the information they want to read," said Clet Smith, a beta user and project leader at Truman Medical Center in Kansas City, Mo.

Previously, users had no way to customize data presentation. They were forced to download screens that contain much more information than they actually use, he said.

CoHost also works to give

"user-friendly" data access to a wider base of users, according to Clet Farnell, a financial systems analyst for the city of Albuquerque, N.M., another beta site.

Prior to CoHost, city government workers needed to run a decision-support report against the mainframe system or call a staffer in the accounting department to obtain an account balance.

Under CoHost, these users can look up the information themselves from their PCs, Farnell said.

"I'm hoping CoHost allows us to use mainframe applications more to their potential and distribute them out to our end-user community," Farnell said.

User groups face sagging membership and low attendance

CONTINUED FROM PAGE 1

"User groups are probably needed now more than ever, but the explosion of client/server computing doesn't allow anyone to get out of the office," Zwick.

And corporate downsizing and right-sizing have certainly taken their toll on user groups, as IS shops have been forced to absorb more work, often with fewer people. That has become a big problem for many more well-established user groups and professional trade associations.

They have lost members, been forced to merge with other groups or, as in the case of the Microcomputer Managers Association (MMA), have had to file for bankruptcy protection [CW, May 6].

For example, Guide, one of two IBM mainframe user groups, has seen a significant drop in attendance. "It used to be that a company with five or six different divisions would send a delegate from each area," said Linda Mainord, a former president of Guide. "Now that those companies have right-sized, we're usually seeing just one representative."

The Digital Equipment Computer Users Society (DECUS) has witnessed a 40% drop in attendance at its biannual U.S. symposiums in the past decade, said Ted Greenham, executive director of the group.

But not all user groups are hurting. Omnicron, an IS executive user group in Mountain Lakes, N.J., has grown 35% in the past

two years to 110 member companies.

The key to Omnicron's success is keeping conference sessions topical, said president Jim Webber. Upcoming Omnicron meetings will focus on choosing between Windows NT and Windows 95 operating systems on corporate desktops and how to maintain successful corporate World Wide Web sites.

And DECUS hired consultancy Booz Allen & Hamilton, Inc. last year to help it assess the changing landscape. DECUS is following Booz Allen's recommendation to do extensive market research before it builds conference programs.

A variety of pitfalls, such as the following, have tripped up user groups:

- Volunteer officers with full-time jobs sometimes overcommit themselves or don't have the management skills to run a user group.

- Poor structure can lead to a user group's collapse. The MMA, for example, used to have 28 people on its board of directors. "By the time everyone introduced

themselves, the meeting was half over," said Priscilla Tate, executive director of the MMA until 1993.

- User groups find themselves competing with thousands of vendor-sponsored conferences and training seminars.

- Timing is critical. New York Oracle User Group, Inc. no longer holds meetings on

the heels of big Oracle Conferences.

- Communication is key. The Corporate Association for Microcomputer Professionals, for one, has quintupled its mailing lists over the past five years to reach more prospects.

Senior editors Craig Stadelman and Lisa

Picarillo contributed to this story.

MMA's Priscilla Tate:
"By the time everybody introduced themselves, the meeting was half over."

IBM tweaks RS/6000

Company adds SMP features to make processor commercial-friendly

By Craig Stedman

IBM this summer will finally fulfill a promise to make its Unix-like parallel processor less of a bear for commercial users.

Long-awaited support to use symmetrical multiprocessing (SMP) servers on IBM's RS/6000 SP computer system will emerge this summer, sources said. The multiprocessing capabilities will accompany IBM's equally overdue introduction of the PowerPC servers based on the PowerPC 604 chip.

Jeff Lurie, an analyst at Smiley Group, Inc. in Minneapolis, said SMP support will give the RS/6000 SP's more cluster-like feel that should be easier to grasp for users outside of the scientific and technical markets. "It's not rocket science anymore," he said.

Experienced commercial users agreed that the ability to configure SMP nodes on their RS/6000 SPs should yield several important benefits. Those include reduced programming complexity, increased support for running off-the-shelf applications and easier administration.

"IBM is in a very developer-friendly environment," said David Audley, director of investment systems and services at Tiger Management Corp., a New York investment firm that has made multiprocessors to its stable.

RS/6000 SP later this year.

The wide range of off-the-shelf software for SMP platforms also is appealing, Audley said.

Developing parallel applications that run on multiple processors offers more scalability than SMP but also requires "a lot more work," he said. "You don't mind doing that for high-profile stuff, but for a [more generic] application, you just don't want to spend the time."

The RS/6000 SP was supposed to get SMP support last year, but

Time passages

IBM's planned availability of PowerPC-based RS/6000 servers

July: Apple Multimicro with co-processor chip introduced to ship

First quarter of 1997: 320-MHz 604 and 320-MHz 604e processors expected to become available in systems

Second half of 1997: RS/6000 SP PowerPC 604 chip introduced in IBM's AS/400 Division

the arrival was delayed by problems in getting the PowerPC 604 to handle multiprocessing.

Other vendors, such as Hewlett-Packard Co., Digital Equipment Corp. and NCR Corp., have since announced parallel/SMP hybrids, leading IBM to catch up.

Moody's Investors Service, Inc., a commercial debt rating firm in New York, is also looking at bumping up its 16-node RS/6000 SP with 604-based SMP servers.

The multiprocessor would speed up database applications that run on separate nodes and use the RS/6000 SP's communications switch to exchange data, said Bob LaBarre, vice president and director of technical operations at Moody's.

Making it easy

Moody's also hopes to consolidate multiple uniprocessor nodes into a smaller number of SMPs, reducing the size of its machine and making systems management less of a chore. "My theory is, more parts, more problems, and less parts, less problems," LaBarre said. "It's as simple as that."

The announcement of 604-based SMPs and support for using them in the RS/6000 SP could come as early as next week, sources said. IBM declined to comment other than to confirm that each will become available this summer.

▲ A ticket seller uses parallel processing. See page 47.

Mobile pains

CONTINUED FROM PAGE 1

beeper all the time and be on constant call," Sammler said.

Companies are being squeezed by competing trends — the pressure to cut costs and downsize is colliding with the skyrocketing number of wireless users.

And the problem is likely to worsen. Giga Information Group in Cambridge, Mass., predicts that by 2000, 80% of portable users will use notebooks as their primary PC, up from the current 30%.

Mobile users require more support than desktop PC users. International Data Corp. in Framingham, Mass., figures that one technician is needed for every 30 to 30 remote and mobile users, about 50% more than PC users.

And that translates into higher costs. Gartner Group, Inc. in San Jose, Calif., has found that the cost of ownership, including acquisition, administration and technical support for desktops, is \$35,692 per user over five years vs. \$40,704 for laptops.

Part of the problem is that traveling executives run into trouble not encountered by desktop workers, including the following:

- Insufficient battery life.
- Communications/networking difficulties.

• The need for proprietary software and sophisticated middleware for access.

• Wireless technologies that call for special skills and knowledge.

But rather than add mobile specialists to the IS staff or set up a seven-day-a-week, 24-hour-day help desk, firms are increasingly turning to the growing number of suppliers of mobile support services and third-party help desks.

The trend is so new that hard numbers aren't available. But Charles Breed, product marketing manager at remote access equipment vendor Cisco Systems, Inc. in San Jose, Calif., said companies can save up to 20% by outsourcing.

"It depends on the size and application, but you save in salaries, facilities and in head counts," Breed said. "And these days, Wall Street likes lower head counts."

Michael Murray, director of national accounts at Lanier Worldwide, Inc. in Atlanta, said his company has turned to DecisionOne Corp. for mobile support as part of a sales force automation project.

He said although the numbers aren't final, the company expects to save by outsourcing. And it just removes a lot of headaches, too. "We didn't want to build from scratch."

▲ There's hope for the wireless. See page 45.

Lanier Worldwide's Michael Murray says the company expects to save by outsourcing'

Internetworking firms to unveil road map to multimedia

By Bob Wallace

Top internetworking vendors this week are expected to reveal plans for products that allow the simultaneous transmission of voice, data and video traffic from desktop to desktop over Asynchronous Transfer Mode (ATM) networks.

Madge Networks, Inc. in San Jose, Calif., will provide a blueprint for its MadgeOne architecture. Lucent Technologies, Inc. in Murray Hill, N.J., will announce an alliance with Bay Networks, Inc. that will lead to multimedia networking products, industry sources said.

In theory, corporations could use the technology to deliver videoconferencing, imaging, training and distance-learning applications to the desktop — without any one type of traffic suffering performance hits.

Some of those capabilities are possible today with proprietary schemes that don't use ATM. But ATM has a "quality of ser-

vice" feature to ensure that each type of traffic has enough bandwidth and optimal performance.

But the necessary upgrade to existing products won't be available for months. Users can expect to see multimedia support from Madge early next year and from Bay/Lucent later this year or early next year.

Although multimedia isn't ready for prime time in corporate America, analysts emphasized that Madge and Bay — each of which posted poor earnings recently — need a foothold in this emerging market for competitive reasons. Users, however, are concerned with other issues.

"We have to make sure that these multimedia plans are not proprietary because we're interested in interoperability

among multiple vendors' ATM products," said Bill Horst, chief at the U.S. General Services Administration's communications branch in Philadelphia. "Without guarantees of end-to-end interoperability with ATM, multimedia won't become a re-

Multimedia with MadgeOne

Collage 250	Workgroup ATM switch
Collage 260	Workgroup ATM switch

quirement for us."

Madge and Bay aren't the first to address the need to provide multimedia support to the desktop. 3Com Corp. rolled out a similar, proprietary scheme called Priority Access Control enabled in the fall

of 1994 and has many switching products that support it, but it was designed for switched Ethernet links, not ATM.

Analysts said MadgeOne is an architecture that calls for upgrades to existing LAN switches so that they can support voice and video traffic in addition to data (see chart). MadgeOne uses voice-over-ATM technology developed by longtime private branch exchange vendor Mitel Corp.

Eventually, the MadgeOne blueprint will be expanded to cover wide-area networks — an extension made possible by the firm's purchase of WAN access products powerhouse Telcos Communications Corp. in January.

Sources said the Bay/Lucent alliance will bring the two to offer virtually the same capabilities as MadgeOne.

Starting In October, Data Warehousing Enters a Whole New Dimension.

SAS Institute Introduces the First Integrated
Data Warehouse and OLAP Solution.

Soon we'll launch the first multidimensional database that's tied directly to a complete end-to-end data warehousing solution...making data query faster and easier than ever. *Plus* reach-through options you can use to visualize your detail data. *Plus* new reporting objects you can apply directly to your database.

Our new multidimensional database is at the core of SAS Institute's OLAP solution—which includes the SAS® Data Warehouse for managing, organizing, and exploiting data...a full client/server environment...and a web enabler.

Yours FREE...A Guide to OLAP Success

Before you settle for an ordinary OLAP solution, see what's on the horizon in our free guide, *A Formula for OLAP Success*. Just give us a call at 919.677.8200 or send us E-mail at ew@sas.com.

HAPPENING

Suite analyzes 'net impact on key apps

By Patrick Dryden

Make Systems, Inc. is overhauling its network analysis and design tools so planners for the first time can gauge the Internet's effect on vital client/server business applications.

Release 2.5 of NetMaker XA can track Internet traffic to interpret its impact on more than 100 applications. It includes new profiles for browsing the World Wide Web or an intranet.

"Now, Make's users can assess the impact of the Internet on key applications like

SAP R/3, Lotus Notes and Oracle databases and prepare for deployment of intranet-based applications," said John Morency, principal at The Registry, Inc., a network consultancy in Newton, Mass.

The Mountain View, Calif. company's move is timely because Internet usage is

causing many corporations to be concerned about bandwidth utilization, said Jennifer Pigg, vice president of data communications at The Yankee Group, a market research firm in Boston.

Competitors such as Optimal Networks Corp. in Mountain View, Calif., provide similar capabilities for examining Internet activity, the said. "But no one offers a suite of tools that goes further in suggesting upgrade scenarios," she said.

Reading managers' minds

There is a "general queasiness in the marketplace" about how Web browsing affects applications, said Steve Howard, CEO of Make Systems.

"Network managers worry about the unwashed mass of Internet applications gobbling up bandwidth from their mission-critical business functions," he said.

Typically, an integrator or capacity planner will track a network's baseline performance before deploying a new database or other application. Now NetMaker XA can monitor and simulate Web browsing, along with other applications, to project their interaction and responsiveness.

"If performance suffers, you can analyze why and figure out how to fix by redesigning some parts or applying policies to limit Web browsing," Howard said.

Other enhancements to NetMaker XA include automated discovery of frame-relay circuits, which helps users visualize wide-area network performance, and design tools that accommodate usage patterns that shift by time of day.

And for the first time, those who manage router-based networks can experiment with survival modeling software, Howard said. A Survivability Module for the analyzer tool can project the effect of a router's failure on application response time and traffic flow.

Those upgrades improved network analysis for beta-tester Dan Tulledge, a senior performance engineer at AlliedSignal, Inc. in Morrisville, N.J.

"We've used Netmaker as a traffic cop, but now we can [believe] more traffic," Tulledge said. For example, operators who manage the frame-relay WAN can easily choose a subset of traffic to analyze in order to understand bandwidth demands.

"What was a three-day effort for our whole network is now an automated, overnight task," Tulledge said.

NetMaker XA 2.5 costs between \$7,000 and \$95,000, depending on the number of tools and modules required.

But few organizations are prepared to get their money's worth from this sophisticated suite, analysts said. Few large support staffs include anyone classified as a network designer or performance modeler, and the typical firefighting mode precludes planning-and-design projects, Morency said. That is why Make Systems now urges large integrators and consultants and offers its own consulting services for \$1,750 per day.

Network analysis

IT'S HOT!

The Internet Commerce Expo

September 9-12, 1996, Anaheim Convention Center, Anaheim, California.

Dedicated to the development of internet commerce via the World Wide Web and the growth of the corporate intranet.

Hot Event. Cool Customers.

If you're a corporate decision maker, ICE is your best opportunity to find the productivity enhancing solutions you've been looking for.

Hundreds of leading hardware, software, and network services vendors will be at ICE to show you how to increase productivity and profitability via the latest internet technology.

A special 3-tier conference will provide a full range of hot topics that deal directly with the needs

of developers, IT managers, business managers and senior executives.

And you won't want to miss The Internet Open—an exciting new floor show that will get everyone fired up with the industry's largest-ever on-line demonstration of user applications for the World Wide Web.

If it's hot, it's here.

This is a must-attend show. So mark your calendar now for ICE. And this fall, get where it's hot!

To register and pay on-line: visit our Web site at <http://www.idg.com/ice>. Or call 1-800-667-4ICE (4423). Or fax 1-508-578-4325.

How Forté Became The Fastest Growing Systems Software Company In History

With all the shouting and outrageous claims being made about systems development tools, we thought you might like to cut through the confusion over application development breakthroughs. Simply put, we *really* have one, and our success speaks for itself.

The breakthrough: application partitioning. You develop as if for one machine, and the Forté Application Environment™ seamlessly, automatically and dynamically distributes your application objects across however many servers and for however many clients, irrespective of platform, operating system or RDBMS. Period.

If you need to develop, deploy and manage high-end client/server applications, we invite you to spend half a day at the next Forté seminar. Call 800-90FORTE (800-903-6783). Or reserve your seat via the Web.

The Second Annual
World '96

In the CA-World '96 Test-Drive Area, you'll be able to pull up a chair at a terminal and take a Computer Associates software product for a spin — on your own, at your own pace.

General Colin L. Powell (Ret.) served as the twelfth Chairman of the Joint Chiefs of Staff. As a recipient of the Defense Distinguished Service Medal, Army Distinguished Service Medal, Defense Superior Service Medal, Legion of Merit and Soldier's Medal and Bronze Star, General Powell will be the most decorated keynote speaker at CA-World '96.

Simultaneous CA conferences in
266 rooms:

ADC
BAC
CADRE
CAMUS
ESAC
GEM
IDIG
IMC
InfoExchange
IngresWorld
opsXchange
Partnership
PRMS
TechniCon

CA-World '96 is your "World Pass" to all the CA conferences being held that week. This means you can attend sessions at any of the 14 conferences.

7-16-96

Be a part of 2,763 interesting and informative technical and end-user sessions given by industry experts, people who implement the software that runs your business.

Stop by the Internet Pavilion and learn about the World Wide Web, Electronic Commerce, building real world applications on the Internet and how to Surf the Net hands-on.

Have a technical question? Visit the Technical Compendium. Open during conference hours and staffed with CA Support/Development, CA experts are on hand to help you with your individual needs — one on one. You can also use the compendiums to get information about local user groups.

Where Else In The World Can You Do All This???

10:00 AM

The World Resource Center will be packed with over 200 exhibitors. Look for these exhibitors: Fujitsu, Symbol, Data General, Compaq, IBM, Digital and many, many more.

10:45 AM - 12:15 PM

Take advantage of any of the 150 free education classes on important industry issues like client/server, UNIX, TCP/IP, DEC OSF Application Design or the Internet. Normally, you would have to pay hundreds or thousands of dollars, but at CA-World '96 they're free.

1:00 PM

Charles R. West, chairman and chief executive of Computer Associates, leads a list of industry leaders, like Bill Gates, who will be speaking on new trends, new technologies and new ways to profit from business software now and into the next century.

1:00 PM - 3:00 PM

CA-World '96 is 5 technology-filled, information-packed days. Listen, learn, participate and share all the latest in technological breakthroughs and industry trends. At CA-World '96, you can get up-to-the-minute information about systems management, client/server technology, application developmental solutions, object-oriented languages, UNIX, business applications...you name it, it will be there.

Client/server apps to plug in to open standards

By Julia King

Users will see a bumper crop of plug-and-play enterprise applications by year's end if vendor members of the Open Applications Group (OAG) follow through on delivery commitments made last week.

SAP AG, Oracle Corp., Marcum Corp., QAD, Inc. and American Software Corp. all agreed to ship OAG-compliant versions of their client/server products before Dec. 31. Dun & Bradstreet Software will be first to market with an OAG-compliant version of its SmartStream software, which will be

available later this month.

Meanwhile, several other OAG members, including PeopleSoft, Inc., J. D. Edwards & Co., Texas Instruments, Inc., Software 2000, Inc. and IBM Manufacturing Solutions Unit, have promised — in writing — to develop new products accord-

ing to OAG standards.

"There was a lot of skepticism before, but now vendors are committing to writing to make their applications compliant with the OAG standard," said Paul Margolis, chairman of the 17-member vendor consortium.

With OAG-compliant applications, "All the pieces will have to do is get a patch card and plug it in at both ends," he said.

G. D. Seile, a pharmaceutical company in Skokie, Ill., is among those firms betting on OAG-based mix-and-match software. The firm is implementing SAP's financial applications and Marcum's Prism manufacturing software.

"We are counting on their compliance with OAG specifications to make these products work together," said Anil Monga, senior project manager.

The OAG was formed in 1994. Its mission is to furnish users with multivendor, best-of-breed, client/server applications, all of which can be integrated out of the box without additional software interfaces. This is done by passing data among applications in a form that all can understand.

The OAG last week published its second set of specifications, which covers how manufacturing applications, such as inventory and production control, interoperate with financial applications. The group's first specifications, released last December, covers interoperability among general ledger and inventory applications.

The OAG specifications are available for free at the group's World Wide Web site: www.oag.org.

COMPUTERWORLD's Code of Ethics

1. Computerworld's first priority is the interest of its readers.
2. Editorial decisions are made free of advertisers' influence.
3. We insist on fair, unbiased presentation in all news and articles.
4. No advertising that simulates editorial content will be published.
5. Plagiarism is grounds for dismissal.
6. Computerworld makes prompt, complete corrections of errors.
7. Journalists do not own or trade in computer industry stocks.
8. No secondary employment in the IS industry is permitted.
9. Our commitment to fairness is our defense against slander.
10. All editorial opinions will be clearly labeled as such.

WORDS WE LIVE BY.

When you pick up a copy of *Computerworld*, you know you're getting the most objective, unbiased news and information in IS. Our code of ethics guarantees it.

Why do we make such a big deal out of editorial integrity?

Because the words you read in *Computerworld* often have a dramatic impact on your business, your career, and your future.

You use this information to evaluate new products. To get a candid view of emerging technologies. To find out the inside story on corporate strategies. To decide whether to jump ship or stay in your current job. To get the edge on your competition.

In short, *Computerworld* is filled with the words IS professionals like you live by.

COMPUTERWORLD

Webmasters

WORDS YOU WORK BY.

Week in and week out, our editors and reporters call it the way they see it — on issues ranging from network management to reengineering. They dig deeply to bring you the most accurate, comprehensive news in IS.

It's no wonder over 145,000 IS professionals pay to subscribe to *Computerworld*. Shouldn't you? Order today and you'll receive 51 information-packed issues. Plus, you'll get our special bonus publication, *The Premier 100*, an annual profile of the leading companies using IS technology.

Call us toll-free at 1-800-343-6474, or visit us on the World Wide Web at <http://www.computerworld.com>. To order by mail, use the postage-paid subscription card bound into this issue.

You'll get the kind of straightforward, impartial reporting you can work by. You have our word on it.

SOLUTIONS

**THERE'S A
REASON WHY FIVE
OF THE BIG SIX
ACCOUNTING
FIRMS BUY DELL.**

"Risk" is hardly an accountant's favorite word. So for our Big Six customers to invest more than \$56 million in Dell PCs over the past 12 months, they had to feel that it was an incredibly safe move. Here's why:

For one thing, the computers we build are built for big business. They're custom-built, in fact, in ISO 9002 certified facilities to give our customers the power of industrial-strength computing. And they're built with industry-standard parts, instead of proprietary ones, and backed with a guarantee of network compatibility.

For another, we really understand how to work with big business. We know that keeping our machines up and running isn't just an imperative, it's mission-critical. Which is why we deploy a nationwide army of local account executives and systems engineers via the field each and every day.

How did we get all this first-hand knowledge of our customers? By staying in touch with our customers at every turn, from selling directly to them to answering the phones when they call for service. A way of doing business that 5 of the 8 biggest airlines, 12 of the 13 largest telecommunications companies, 4 of the 5 largest mutual insurance companies – in fact, 60% of the Fortune 500 – wouldn't have any other way.

So if you're looking for a computer company that really understands big business, Dell's the place to land.

AT&T PocketNet Phone and Mitsubishi MobileAccess phone with Unwired Planet software

- Operate with off-the-shelf Web servers and are compatible with existing Web applications
- Applications managed at the server level are reflected in the browser client on the phones
- Receive text-based information but no graphics or multimedia
- Allow users wireless access to the Internet and corporate intranets and enable two-way messaging and cellular voice communications

Smart phones dial up data communications

By Mindy Blodgett

Picture a business traveler heading to the airport in the back of a cab.

She grabs her "smart phone" and makes a quick call back to her office, then uses the device's keyboard to access the Internet for information about the gate for her flight.

Just before she arrives at the airport, the telephone emits a brief, telling her she has a text message.

Some observers said the wireless industry finally has its killer application in last week's announcement from AT&T Wireless Services in Kirkland, Wash. The company has debuted a device that gives users wireless voice and data access to the Internet and corporate intranets.

AT&T PocketNet Phone, manufactured by PCSI in San Diego and equipped with software from Unwired Planet, Inc. in Redwood City, Calif., will provide two-way messaging and access to electronic mail and information such as airline flights and financial data via Cellular Digital Packet Data (CDPD).

AT&T officials said the device, which will be available to corporate users later this year, will cost about \$300, plus about \$40 per month for airtime.

Mitsubishi Wireless Communications, Inc. in Sunnyvale, Calif., an AT&T partner, is adding the same capabilities to its MobileAccess phone.

What's new?

Industry analysts said the phones and services will give users unprecedented, flexible access to critical information. They also predict that the devices will advance the adoption of CDPD, a wireless data communications technology that hasn't lived up to its early promise.

"The significant thing about this an-

nouncement is that the device will be a key enabler for a lot of applications that will get quick information into users' hands," said Robert Egan, an analyst at Gartner Group, Inc. in Stamford, Conn. "The typical business traveler is in the field making decisions about such things as financial markets, and the short messaging ability as well as Internet access of this device will be important."

Craig Mathias, an analyst at Farpoint Group, Inc. in Ashland, Mass., said the smart phones "are one of the things that can crack this wireless field right open — I think these are going to fly off the shelves."

"The important thing about this device is that it gives you great flexibility in a single package," he said. "CDPD has been rolling out networks more slowly than we thought, but these are the kinds of applications that can move this along."

Will it sell?

AT&T sees the device as a potential replacement for cellular phones and pagers. But will users be drawn to it?

Jack Frame, a vice president of sales at CoreStates Bank in Philadelphia, said the features are attractive, "but the price still seems a little steep. And do I really want another device? What's unique, giving wireless capabilities, I'm not sure. I need a device like that, and I don't know if I could convince my manager to spend \$300."

And there are some sizable pieces yet to fall together, analysts said. CDPD networks are still rolling out, and more interlocking agreements among rival wireless carriers are needed to give smart phone users nationwide access.

"They still have to work through some infrastructure and maturity issues in CDPD," said Dan Merriman, an analyst at Giga Information Group in Cambridge, Mass. "But this has the potential for being a very significant wireless solution."

IRS to require electronic filing

By Gary H. Anthes

WASHINGTON

The Internal Revenue Service this month is notifying 1.2 million companies that they must begin paying business taxes electronically by year's end.

But according to a recent survey, three-quarters of companies are unprepared for the mandate, which carries a stiff 10% penalty for noncompliance.

Worse, thousands more may not even be aware of the mandate or the electronic payment requirement.

According to Automatic Data Processing, Inc. (ADP) in Roseland, N.J., less than one-quarter of 500 companies surveyed are aware of the IRS regulation, and of those that know of it, most don't yet know how they will comply.

"The first inkling that taxpayers have had about this was a mailing begun by the IRS three weeks ago," said Carolyn Reiley, director of government affairs at the American Payroll Association here. "There has not been the kind of public awareness campaign that a change of this magnitude warrants."

Happy New Year
The regulation has already kicked in for 1,500 of the largest U.S. companies, which use an older system called TaxLink. But it really takes hold Jan. 1 when many small and midsize companies must comply (see chart).

Electronic payment is mandated when employment taxes reach a certain thresh-

old, but once that level is reached, all business taxes must be paid using the IRS' new Electronic Federal Tax Payment System (EFTPS). That includes federal excise taxes, state payroll taxes, state income tax and several other levies.

Baptist Hospital in Nashville runs multiple payroll systems on its mainframe and has some as a service bureau. Karen Carter, EFTPS project manager, said Baptist Hospital has been using TaxLink, the predecessor to EFTPS, but must convert

Pay-up time

If a company deposited more than \$50,000 in employment taxes in 1995, it must make all federal tax deposits via EFTPS beginning Jan. 1, 1997. Larger companies are already required to pay electronically.

Employment Taxes deposited	In calendar year	Payment deadline	Using
\$47 million	1994	Jan. 1, 1996	TaxLink
Required	1995	Jan. 1, 1997	EFTPS
\$50,000	1996	Jan. 1, 1998	EFTPS
Required	1997	Jan. 1, 1999	EFTPS

* Electronic Federal Tax Payment System

Source: Internal Revenue Service, Washington

to EFTPS by Jan. 1.

That is a "major concern," Carter said. "There are 1.3 million taxpayers going onto EFTPS, a product that has never been tested by taxpayers." She said she just sent in the hospital's EFTPS enrollment form and is waiting for EFTPS software from the IRS.

Though the concepts behind electronic payments are fairly straightforward, complying with IRS regulations will require close coordination among taxpayers' systems, payroll, accounting and tax staffs and between taxpayers and their banks.

The facts actually will pay off for this health care system. See page 75.

Pick your poison

Companies that comply with the new IRS requirements for electronic filing must specify one of two payment option: debit or credit.

Under the debit option, the taxpayer initiates each payment by instructing one of two financial agents designated by the IRS to withdraw funds from the taxpayer's bank and route the money to a U.S. Treasury account at a Federal Reserve Bank.

With the credit option, taxpayers contact their banks and order them to

initiate transactions for specified amounts. With either option, taxpayers may be able to initiate payments via Touch-Tone telephones, PCs or voice instructions.

Large firms with many tax payers may want to modify their systems to make payments automatically, said Steve Kobren, a director at ADP.

No matter which option is chosen, coordination is key, said the American Payroll Association's Carolyn Kelley.

Why you'll be happy that people are
surfing the net on company time.

It's not the Internet. It's your new intranet, where your users can share information better than ever before. All over the world, businesses like yours are starting to build intranets to improve information flow within their organizations, with customers and with partners. Intranets combine the Internet's easy navigation with the power and productivity of personal computing. So users not only have the ability to find relevant company information more quickly and easily, they can also employ Microsoft applications to create, analyze and collaborate in new ways.

With the Microsoft® Office for Windows® 95 family of applications, you can get the most out of your intranet. Because users can share information on your intranet using the Microsoft Office applications they're using today. For instance, documents created in any Office application can automatically be saved as HTML® for others to view in any web browser. Or users can post the same documents in their native file formats to facilitate more flexible, in-depth analysis and collaboration. Add the new Microsoft FrontPage® web authoring and management tool, and users can easily create and update their own interactive, content-rich sites by simply clicking, dragging, and dropping.

So of course you'll be delighted to see users browsing and sharing information within your intranet.

It's just a sure sign that you've streamlined communications to help people make smarter decisions and work better together. To learn more about how Microsoft can help make your intranet as easy to surf as the Internet, visit www.microsoft.com/intranet/

New leadership to light Candle's way

By Bob Francis

Closely held Candle Corp. has brought in a new president and chief operating officer to help it branch out into distributed systems management.

Robert J. LaBant, formerly an independent consultant and a senior vice president and general manager at IBM, was named to the newly created position last week.

"I believe CIOs have been charged with managing distributed systems [Unix and NT], and we need to give them the tools to do it."

Bob LaBant,
Candle president
and chief operating officer

Aubrey Chernick, Candle's founder and chairman, held those positions before LaBant. LaBant's main charter will be to move Candle from a provider of centralized systems management products to products for new distributed Unix and Windows NT environments.

Candle last year already made moves in that direction with systems management products for Unix systems and agents for NT systems. Later this year, the company plans to add products to manage NT systems from NT servers, company officials said.

But Candle is following in the footsteps of some of its competitors. Legent Corp. is now part of Computer Associates International, Inc. and is moving quickly in the distributed systems management area. And IBM, with its purchase of Tivoli Systems, Inc., is also a major player there. Candle will have to both compete and partner with those two companies to make an impact in distributed systems management, analysts said.

According to LaBant, the San

ta Monica, Calif., company will concentrate on developing products for Unix and NT operating systems in the next year. "I believe CIOs have been charged with managing these distributed systems, and we need to give them the tools to do it," he said.

According to International Data Corp. (IDC), Candle led the performance management market last year with a 13.6% market share, followed by Boole & Babbage, Inc. with 8.4% and Landmark Systems Corp. with 3.5%. The rest of the market was split among smaller players, said Paul Mason, an IDC analyst. Regarding the addition of LaBant, Mason said, "This is really Candle's best shot. If they don't make it now, they may very well stink."

According to Sam Albert, president of Sam Albert Associates, a Scarsdale, N.Y., consulting group, LaBant's ability to build partnerships should serve him well at Candle. "One of the hallmarks of his time at IBM was when he headed the AS/400 group and delivered a very successful product by building strong partnerships," Albert said.

According to LaBant, the San

The land of kilts and kilobytes

Scotland's 'Silicon Glen' faces nagging challenges

By Michael Goldberg
EDINBURGH

The University of Edinburgh, one of Scotland's most advanced academic centers for electrical engineering, is a barometer for this country's high-technology health.

The strengths are real. Scientists are teaching the next generation of semiconductor designers in the school's fabrication facility. Researchers are on projects to bring new technologies to the electronics and computer industries.

Yet there are nagging challenges facing Scotland's "Silicon Glen."

Just like high-tech companies in California's Silicon Valley, firms in Scotland face a seeming unending demand for talent to improve existing products and to develop the next "big thing."

So, as fast as the university turns out graduates, industry looks for more people with higher levels of skill.

"Everyone in Silicon Glen sees that the quality of the people here is great but that we need more of them," said Bruce Diamond, managing director at National Semiconductor (U.K.) Ltd. in Greenock, Scotland, a city 25 miles west of Glasgow.

The U.K.'s plans, announced last week, to site a national microelectronics institute at Heriot-Watt University in Edinburgh is a start toward addressing the talents question, according to Diamond and executives at other electronics companies.

Lured by relatively cheap land and labor, tax breaks and government-sponsored promotions, dozens of high-tech companies from the U.S., Japan and Europe have bases in Scotland, a nation of 5 million that is about the size of Maine.

National Semiconductor will invest \$270 million over the next three years to expand a plant

that makes chips for products such as antilock brakes.

IBM last month announced the expansion of its European PC service center in Greenock.

Motorola, Inc. makes chips for mobile telephones in South Queensferry, outside of Edinburgh. Nearby is NEC Corp.'s semiconductor plant. In Edinburgh, engineers for Hewlett-Packard Co. are working on chip design.

Semiconductor executives such as Rod Griffiths, president of the European division of Applied Materials, Inc., said firms need to be poised for growth in spite of recent slumps in the book-to-bill ratio, the supply-and-demand formula for computer chips. "The use of semiconductors has grown and will continue to grow," he said.

The government estimates that Scotland has 7,300 workers in the country's seven semiconductor factories. And although Scottish universities train 3,000 students per year in electronics-related fields, people such as Clive Reeves, an electrical engineering professor at the University of Edinburgh, said more must be done.

"The companies here are expanding and the infrastructure has to be sustained around them," Reeves said.

Computer pioneer Hurd, 85, dies

Hurd

Cuthbert C. Hurd, 85, a mathematician who helped IBM develop the 701, the first general-purpose computer introduced in 1952, died recently at his Portola Valley, Calif., home.

Hurd joined IBM in 1949 to become director of applied science after a stint at the Atomic Energy Commission laboratory in Oak Ridge, Tenn. He later served as

chairman of Computer Usage Co., the first independent software company, and as co-founder of Quintus Computer Systems, seeking to market intelligent software.

When he died, Hurd was chief scientist at Northpoint Software Ventures, Inc. in Framingham, Mass., a risk management software firm.

The rush to do business on the Internet is on. The question is, what will ultimately separate the winners from the losers?

A deciding factor will be your alliance with strategic network partners. Alliances that can help you capitalize on all the power

the Internet has to offer. And when it comes to the Internet, there is no better partner than the people of Cisco Systems.

We didn't just arrive on the information highway yesterday. In fact, we're one of the pioneers who helped create the Internet.

Almost every message that travels over the Internet moves through Cisco equipment. And our Cisco IOS™ software is the core technology that empowers different hardware devices on the Internet to communicate with each other regardless

THE
INFORMATION HIGHWAY
IS PAVED WITH
RHETORIC, METAPHORS,
AND THE SCAR TISSUE
OF MISINFORMED
EXECUTIVES.

of their make or brand name, ensuring smooth, secure communications whether they're going around the corner or the globe.

All of this makes us uniquely able to help you build the type of infrastructure your company needs to employ the

Internet for marketing, customer support and most importantly, more sales.

The metaphors, rhetoric and promises will only carry you so far. In the end, experience and expertise will surely take you much farther down the road.

Visit us on the Web at www.cisco.com. Or give us a call at 1-800-778-3632, ext. 159108.

We'll help to ensure that your company's trip on the Internet is a safe and profitable journey.

Is IBM next?

In the past two weeks, a lot of brain-power has been focused on analyzing whether Digital Equipment Corp. is the next Wang Laboratories. I wonder if the bigger question is whether IBM is the next Digital.

When you consider the similarities in the two companies' situations, the analogy is hard to miss. Digital blames a lot of its recent troubles on slow sales of some PCs and an inability to meet demand for others, particularly its popular Ultralite notebooks. IBM's market share in PCs also has been falling steadily for the past year, and it's also unable to keep up with laptop demand.

Digital is experiencing weakness in Europe. IBM is equally vulnerable, with 40% of its business in Europe. Digital is fighting against plummeting sales of its VMS platforms. IBM's legacy MVS systems are enjoying a bubble of strong sales, but no one expects the phenomenon to last more than a few years.

Neither vendor has a strong Unix message. Digital has a fast Alpha chip, but no vendor of any consequence supports it. IBM has the same problem with the PowerPC and a version of Unix that's considered one of the weakest in the market. Neither vendor has a compelling applications software story.

Of course, each vendor also has its unique problems. Digital's costs are still out of line, and it has been unable to get its reseller channels in shape. IBM is hemorrhaging in storage, which was once one of its biggest businesses, and has yet to figure out how to recoup its multi-billion-dollar investment in Lotus.

Each also has strengths. Digital has close ties to Microsoft and Oracle and produced the Alta Vista search engine, which brilliantly showcases Alpha performance. IBM has Integrated Systems Solutions Corp., the AS/400 and a fingerling aura of customer loyalty.

Add them all up, though, and the bottom-line is weirdly similar. These are two vendors trying desperately to make the transition from a disappearing legacy to some new world order. Yet neither has a dominant position in any of the markets that will define the future. They are fighting organizational inertia, blotted worldviews and fawning scrutiny from Wall Street. They are participating in the 2-year-old high-tech boom, but their long-term growth strategies carry plenty of risk. Digital took a hard fall a couple of weeks ago. I wonder if IBM has the magic working for it to avoid the same fate.

WOMEN IN INFORMATION SYSTEMS MS. MIS

'Sexism in IS' strikes chord with readers

I found Laura DiDio's article "Sexism in IS: Not gone, not forgotten" (CW, June 24) very interesting. I definitely do not dispute your general point, but do wonder about some numbers behind the 1995 survey, which was included in her article. For example, it states that the 15 population is 300,000 and the 70+ is 70,000. However, it also states that high schools do not encourage girls to pursue technical careers. Hence, women probably are less interested in IS than men.

So do women have a harder time or an easier time getting an IS job than equally qualified men? This is of special interest to me because my wife is majoring in computer science. We often maintained that she should be able to get a better salary than I did starting out, because being a female would be an asset in IS, not as tokens, but because women are different from men and would probably be better at coding toward the female consumer. (I hope you don't find that sexist.)

Furthermore, I would find it more revealing if the salaries being com-

pared were for the same experience level — for example, to compare average salaries for men and women with five, 10 and 15-plus years of experience.

Beth Hocking
Athens

I very much appreciated your article on sexism in IS. I have had an interesting experience in my own workplace that shows how utterly pervasive sexism is among men and women.

The senior staff in this organization's information systems unit has a combined experience base of over 40 years in networks and all types of computers. We not only run — very successfully and cost effectively — a multiplicity of networks, but we designed the automation from the ground up. The last two fiscal directors who took positions here both fancied themselves big-time computer hackers. One could not get beyond his Mac, and the other cannot get beyond learning AmiPro. Yet our organization's staff is impressed with their amateurish analysis, based mainly on monthly readings of PC Magazine. And now the organi-

zation staff regularly questions the IS staff's decisions based on these fiscal directors' "erudite" insights.

J. Evelyn Nakberg
Washington

I enjoyed the recent Ms. MIS article but found it ironic that, four pages later, the next article in the issue was titled "Real men don't use Web tools." It was especially ironic to me because the only person in our MIS department doing any Web scripting at all is a woman.

Lynn Little
Portland, Ore.

I agree with almost everything in Laura DiDio's article. The only exception I have is that we women seem to alienate our spouses to get away with similar behavior.

My friends are consistently amazed at the amount of cooperation I receive from my husband. He understands the long hours, the crazy schedule, etc. If he needs to work long hours, I fill in the gaps at home. He understands that it is not interfering with my job to care for the children and the house.

We need to take some responsibility for the nature of how families run. I appreciate the advice to stand firm ground. It's hard, but it works. It's the only way things will change.

Nancy Campbell
Denver

FROM A BULLETIN BY META GROUP, INC., IN STAMFORD, CONN., ABOUT THE SALE OF DUN & BRADSTREET'S SOFTWARE TO BAIN CAPITAL, INC.

While this is a reasonable deal for Bain Capital ... we are concerned about Bain's lack of interest in Dun & Bradstreet's Software's SmartStream client/server-based systems. Users should therefore avoid further SmartStream commitments until the smoke from this "In Line" acquisition clears.

We believe the spin-off ... will cause SmartStream to struggle as a product line.

FROM A REPORT BY DONALD A. DE PALMA, SENIOR ANALYST AT FORESTIER RESEARCH, INC., IN CAMBRIDGE, MASS. —

Internet search engines like Yahoo and ... Alta Vista will reset the database and data warehousing markets beginning in 1997.

[Large] companies are struggling to get all their corporate information — both structured and unstructured — into their decision-making process. Eighty percent of their business intelligence is still in documents, not in SQL databases.

Internet search engines will try open this unstructured data and leave traditional databases vendors like Sybase, Oracle and IBM disengaged in a much smaller role for managing only structured data.

The Internet enables armies of users equipped with search engines to get in a whole new world of information. Most of it will be in text files, not Oracle or DB2 warehouses. What users want is access to both multimedia and structured data, all through the same browser interface. User reliance on search engines like Yahoo for information access means a hungry distributed role for server databases that are linked to structured data — which is just about the entire relational database industry.

Users will get zapped by browser plug-ins

Mel Baizada

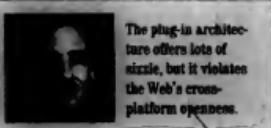

With the release of the Navigator 2.0 Web browser, Netscape Communications Corp. introduced the "plug-in" browser architecture. Plugins are chunks of later-downloaded code that allow users to run animation, video and audio programs within the browser window.

There's no doubt that these plug-ins — such as Acrobat, Shockwave and RealAudio — are flashy enhancements to the basic Web browser. But there are serious drawbacks to the plug-in approach. It has the potential to shackle users to a proprietary architecture and runs counter to the fundamental openness of the Web.

Netscape introduced the plug-in concept to entice third-party developers to add dazzling functions that would make the Netscape browser even more pervasive than it already was. The logic is simple: Make it easy for users to get feature-rich software that works with only your browser.

Most plug-ins are available only for Navigator 2.0 running on Windows-based PCs. They have to comply with Netscape's plug-in application programming interface. A few Macintosh-compatible versions are being developed, but no plug-ins have been developed for Unix-based systems, and few (if any) plug-ins are cross-platform.

In other words, because most plug-ins run only in the native Windows environment, they paint

The plug-in architecture offers lots of sizzle, but it violates the Web's cross-platform openness.

users into a proprietary corner. That's fine for Windows-only intranets, but it isolates users from the wide-open, public Internet.

There are other problems with plug-ins. Plugins say we're moving away from the "fat client" syndrome. But the slimmed-down network computers probably won't be able to run Windows or plug-ins.

Analysts at Meta Group, Inc. recently questioned the maturity of plug-in technology. During one demonstration, a single plug-in caused the browser to crash. If a browser is made unstable by a single plug-in, imagine the risks of running multiple add-ons simultaneously.

The Web gained acceptance so rapidly because of its near-universal availability, ease of use, graphical information content and platform-independence. The Hypertext Markup Language (HTML) and Hypertext Transport Protocol (HTTP) are the open technologies that made it all

possible. With the addition of Common Gateway Interface (CGI) gateways and cuttables, as well as the ability to bind HTML to databases, Web sites have gone from being mere billboards to systems capable of real business transactions.

Now we have the much-hyped arrival of the Java programming language. Although Java is essentially a fancy plug-in, it's platform-independent, so it enables developers to create "write-once, run-anywhere" apps. We'll be better off building applications with the alphabet soup of HTML, HTTP, CGI and Java — all open technologies — than with a hodgepodge of plug-ins.

History has a shing about repeating itself, even in the computer industry. Often we've seen promising technology lead us from one proprietary regime to another. PCs and Windows "kicked" us from IBM mainframes but delivered us to Microsoft's door.

The Web presents us with a new opportunity. We must guard against veiled lock-in strategies and resist the temptations of flashy, quick fixes. The future of the Web lies in open tools, components and executable content. Today's proprietary plug-ins can't keep pace.

Baizada is president of Mount Laurel, N.J.-based Bristow, Inc., a provider of advanced application development products, training and services.

PC upgrades: The good, the bad and the ugly

John Gantz

As a research outfit, my company keeps tabs on the \$10 billion outsourcing market. It's big, it's growing, it's dynamic. And one of the hottest segments in the outsourcing of PC administration and upgrades, where the growth rate is more than 45% a year.

This month, we became one of our own statistical victims. We embarked on a companywide upgrade from a hodgepodge of PCs and Macintoshes to a standard set of hardware and software. And we chose an outsourcing vendor to do the job.

This upgrade has had its problems. One unique (and unjouified) view among end users is that only our own information systems group could have screwed up this task more than the outsourcing vendor has. But the reality is better than the perception. All told, this upgrade isn't going too badly. We'll have new PCs and software on every desk well before the year 2000 problem steps in our tracks.

In theory, IS managers choose to outsource PC services because the outsourcing will cost less, offer faster service and provide expertise unavailable in-house.

These are all nice reasons, but none of them are true. Our upgrade is going to cost more and take longer than it would have if we did it in-house. After the first system cutover, it was clear

Outsourcers may be costly and slow, but they force us to clean up their acts.

that our IS staff knew more about desktop computing than the outsourcing vendor. Ultimately, this will be a higher quality upgrade than if we had done it ourselves, but the reason will be our preparation, not the skills of our outsourcing.

Despite the problems, using an outsourcing was a stroke of genius on the part of our IS group. Here are five reasons why:

• Using an outsourcing made us get organized. End-user departments took the upgrade much more seriously because we had hired guns coming in. We took inventory. We planned. We even went to training classes.

• The outsourcing made our IS staff look good. It was our guys who taught the outsourcing about plug-and-play technology problems. It was our guys who found lost files and diagnosed keyboard and monitor problems.

• The prospect of chargebacks for user-caused problems, such as missed training, broughtinci-

pline to an usually end-user bunch. We'd rather pay if our IS group did that. The hidden costs of PCs are fully exposed — ugly, but in clear view.

• End users can see what's going on. Our IS group generally labors in obscurity, except when it's laboring under unfair bad press. By using an outsourcing, spending on IS has become an "investment in infrastructure" rather than a necessary evil or black hole.

We know more about our IS group than at any time since we got our first LAN.

• We're upgrading PCs companywide instead of piece by piece. Now, perhaps because we're trying to get companywide electronic mail and groupware, we're getting everyone to the same place at once.

Yes, outsourcing costs more, and we could do this better ourselves. But left to our own devices, we wouldn't be as disciplined. Signing up an outsourcing is like hiring a cleaning service. You have to straighten up first to get your money's worth.

The best approach might be a blend of the two: Set up your IS group as an independent outsourcing firm and sell services back to your company on a project basis. Then your IS group might finally get some respect.

Multimedia makes the grade

Colleges roll out big hardware guns to handle apps

By Craig Sedman

Colleges and universities are starting to act as test beds for networked multimedia technologies that should soon be deployed in corporate workplaces for training and documents.

And lesson No. 1 is already clear: When you want to shoot multimedia data across a network, get the big hardware guns.

Multimedia data on a network offers the potential for a more flexible and dynamic environment than is possible now with CD-ROMs that are sent to end users. But information systems departments have to make sure their servers and networks don't get bogged down by images and full-motion video clips.

At Rensselaer Polytechnic Institute (RPI) in Troy, N.Y., this need for ample power translates into a three-tier architecture scheduled to go live in time for the fall semester. RPI's setup will hook desktop and mobile PCs to IBM RS/6000 Unix servers that, in turn, are connected to a data repository on an IBM mainframe.

"We don't want to deliver wheelbarrow loads of CD-ROMs all over the place. That's insane," said Jack Wilson, dean of undergraduate and continuing education at RPI. The school also wanted to create a campuswide multimedia system that would let its 4,000-plus undergraduate students access multiple academic departments

from a common environment.

But the students are expected to tax the system with up to 6,000 hours of use per week, Wilson said. That forced RPI to design an architecture that would be robust and yet plenty of punch.

Marist College in Poughkeepsie, N.Y., originally planned to use PCs for a multimedia network that got limited use last year and will expand to include more courses in the fall.

But as Marist tried to scale the system during development, it started to run into hardware performance limitations," said Carl Gerberich, vice-president of information services at the school. "We found out that for what we wanted to do, that level of server was more in the way." So, Marist switched to a two-tier multimedia network with a mainframe as its server.

Within RPI's three-tier architecture, the RS/6000 Unix servers will be used by separate departments to cache multimedia data that is heavily in demand. John Kuhl, RPI's dean of computing and information services, said he hopes that will provide fast enough access to the data and will allow IS personnel "to control things from a megaserver" at the mainframe.

RPI also plans to use Asynchronous Transfer Mode switches to handle some of their multimedia needs.

"When you see the size of the images that are involved here, Ethernet gets swamped pretty quickly," Kuhl said.

"When you see the size of the images involved here, Ethernet gets swamped pretty quickly."

personnel "to control things from a megaserver" at the mainframe.

RPI also plans to use Asynchronous Transfer Mode switches to handle some of their multimedia needs.

"When you see the size of the images that are involved here, Ethernet gets swamped pretty quickly," Kuhl said.

Lessons learned

It may not mark the spot. A sticker on a server rack says "Don't stand on me." The sticker is a good reminder that the server's throughput has been slow at RPI ever since the number of server users increased from 8 to 40.

The basics aren't enough. Serving up standard data storage to faculty members won't be enough and it'll be important to have a

Don't underestimate male server performance needs. PEI had to add more memory and was constrained by disk training resources.

Marist had to upgrade faculty PEI had to add more memory and was constrained by disk training resources.

New applications
on the way for the

PDA

By Mindy Blodgett

Users of handheld computers and personal digital assistants (PDA) frustrated by the lack of applications and options will soon get some relief.

IBM recently introduced handheld computers for specific vertical industries that, for example, offer a choice of wireless providers. And industry observers are eagerly awaiting the release of a mobile operating system from Microsoft Corp. Code-named Pegasus, the system features a point-and-click menu and will have easy connectivity with Windows 95 and Windows NT, sources said.

Pegasus is expected to be a true desktop extender with its interoperability with Windows 95 and NT, said Timothy Schmidt, an analyst at Encore Consulting Group, Inc. in Longwood, Fla. "And that is what people are looking for with their PDAs and portables — they need better connections to the desktop."

Pegasus is expected to be announced later this summer.

Hold on to your hats

Compaq Computer Corp., NEC Technologies, Inc. and Hewlett-Packard Co. are considering developing devices using Pegasus, analysts said. Microsoft officials said they hope to aim the operating system at devices less than \$500.

If Microsoft enters the PDA and mobile device market, it could cause an explosion in PDA and mobile usage, observers said.

Meanwhile, IBM recently released wireless computing devices aimed at various vertical markets, including warehouse management, field-data collection, hospital, financial services and retail.

The most recent release was the IBM 4612 Sure Point Mobile Computer, which is available for a starting price of about \$3,445. The portable, pen-based system was devised with retail employees in mind, ac-

cording to company officials.

The wireless device allows employees to switch tasks and access information wherever they are located within a building or store. It has an integrated microphone and speaker for voice applications. It also has PC Card slots that allow for a choice of wireless radio providers, including RIM Mobile Data USA, L.P. and ARIOS Co., as well as Cellstar Digital Packet Data providers.

Mark Sievers, chief administrative officer at Long John Silver's, a restaurant chain based in Lexington, Ky., is testing the Sure Point Mobile Computer. He said it will be used to take orders and check inventory.

IBM 4612 Sure Point Mobile Computer

- Handheld, wireless device
- Has pen-based system
- Supports OS/2 and Windows 95
- Can be used to communicate via E-mail and voice

Sievers said he isn't sure if the company will buy the computers but added, "We have been looking at wireless for years, and this device seems to give us a lot of what we want."

"My dream is for a completely wireless, cashless restaurant someday," Sievers said. "We're very excited about those possibilities."

But he said he would like the devices to cost less. "For this to make economic sense and to buy in bulk," they should go down in price, Sievers said.

Servers

Multimedia makes the grade

Colleges roll out big hardware guns to handle apps

By Craig Stedman

Colleges and universities are starting to act as test beds for networked multimedia technologies that should soon be deployed in corporate workplaces for training and other uses.

And lesson 1 is already clear: When you want to shoot multimedia data across a network, get out the big hardware guns.

Multimedia data on a network offers the potential for a more flexible and dynamic environment than is possible now with CD-ROMs that are sent to end users. But information systems departments have to make sure their servers and networks don't get bogged down by images and full-motion video clips.

At Rensselaer Polytechnic Institute (RPI) in Troy, N.Y., this need for ample power translates into a three-tier architecture built by the Institute for the fall semester. RPI's new will hook desktop and mobile PCs to IBM RS/6000 Unix servers that, in turn, are connected to a data repository on an IBM mainframe.

"We don't want to die when these huge loads of CD-ROMs all over the place," that's "inane," said Jack Wilson, dean of undergraduate and continuing education at RPI. The school also wanted to create a campuswide multimedia system that would let its 4,000-plus undergraduate students access multiple academic departments

from a common environment.

But the students are expected to tax the system with up to 6,000 hours of use per week, Wilson said. That forced RPI to design an architecture that would be reliable and pack plenty of punch.

Marist College in Poughkeepsie, N.Y., initially planned to use PC servers for a multimedia network that got limited use last year and will expand to include more courses in the fall.

But as Marist tried to scale the system during development, it "started to run into hardware performance limitations," said Carl Gerberich, vice president of information services at the school. "We found out that for what we wanted to do, that level of server was more in the way." So, Marist switched to a two-tier multimedia network with a mainframe as its server.

Within RPI's three-tier architecture, the RS/6000 Unix servers will be used by separate departments to cache multimedia data that is largely in dramedy. John Kalk, RPI's director of computing and information services, said he hopes that will provide fast enough access to the data and still allow IS to handle things front a megaserver at the mainframe.

RPI and Marist also plan to use Asynchronous Transfer Mode switches to handle some of their multimedia levels.

"When you see the size of the images that are involved here, Ethernet gets swamped pretty quickly," Kalk said.

Compaq Computer Corp., NEC Technologies, Inc., and Hewlett-Packard Co. are considering developing devices using Pegasus, analysts said. Microsoft officials said they hope to aim the operating system at devices less than \$500.

If Microsoft enters the PDA and mobile device market, it could cause an explosion in PDA and mobile usage, observers said.

Meanwhile, IBM recently released wireless computing devices aimed at various vertical markets, including warehouse, manufacturing, field-data collection, hospital, financial services and retail.

The most recent release was the IBM 4612 Sure Point Mobile Computer, which is available for a starting price of about \$3,445. The portable, pen-based system was devised with retail employees in mind, ac-

cording to company officials.

The wireless device allows employees to switch tasks and access information wherever they are located within a building or store. It has an integrated microphone and speaker for voice applications. It also has PC Card slots that allow for a choice of wireless radio providers, including RAM Mobile Data USA, L.P. and ARDIS, Inc., as well as Cellular Digital Packet Data providers.

Mark Stevens, chief administrative officer at Long John Silver's, Inc., a restaurant chain based in Lexington, Ky., is testing the Sure Point Mobile Computer. He said it will be used to take orders and check inventory.

IBM 4612 Sure Point Mobile Computer

- Handheld, wireless device
- Has pen-based system
- Supports OS/2 and Windows 95
- Can be used to communicate via E-mail and voice

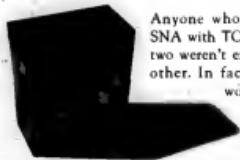

Stevens said he isn't sure if the company will buy the computers but added, "We have been looking at wireless for years, and this device seems to give us a lot of what we want."

"My dream is for a completely wireless, crash-free, restaurant system," Stevens said. "We're very excited about the possibilities."

But he said he would like the devices to cost less. "For this to make economic sense and to buy in bulk, they should go down in price," Stevens said.

IF ONLY IT COULD UNITE THE REST OF THE WORLD
THE WAY IT INTEGRATES SNA AND TCP/IP.

Anyone who's tried to combine SNA with TCP/IP can tell you the two weren't exactly made for each other. In fact, getting them to work together can be a daunting challenge.

REFLECTION SUITE FOR THE ENTERPRISE

COMPREHENSIVE CONNECTIVITY—MAINFRAMES, AS/400, DLCS, COAX DPT, SNA GATEWAYS, TCP/IP INCLUDING TR32705, AS/400 AND SNA GATEWAYS, NS/ROUTER INCLUDED; CLIENT ACCESS, PC SUPPORT, TCPIP (TCP155), UNIX/DIGITAL, LAT, TCP/IP, IPX/SPX, DECNET, AND OTHERS

ENHANCED USER PRODUCTIVITY—WINDOWS-LIKE FEATURES, REMOTE/MOBILE OPTIMIZATIONS, INTERNET/INTRANET APPLICATIONS

CLIENT/SERVER AND PROGRAMMABILITY—VB COMPATIBLE SCRIPTING LANGUAGE, OLE 2.0 AUTOMATION SUPPORTS DOL, HLLAPI, C/C++

EXCEPTIONAL MANAGEABILITY—NETWORK DIAGNOSTICS, CUSTOMIZATION, SIMPLIFIED SETUP

AWARD WINNING SERVICE AND SUPPORT—FREE, ONGOING SUPPORT VIA TELEPHONE AND ONLINE SERVICES

WRQ REFLECTION OFFERS COMPLETE SOLUTIONS FOR UNIX, K, HP, DIGITAL, AS/400, 3270, AND TCP/IP CONNECTIVITY.

ACT ticketing system helps make sure the shows go on

Parallel processing system handles high-volume, time-critical ticket sales

By Gary H. Antes
Montreal

When pop star Michael Jackson schedules a concert in Canada, a parallel processing, fault-tolerant computer is just the ticket.

"There could be 5,000 people in Canada selling Michael Jackson tickets. If they go on sale at 9 a.m., at 9:30 you could have 2,000 people all pressing 'enter' at the same time," said Danny Lok, a vice president at Access Control Telematic, Inc. (ACT).

In addition to having a system that can handle that load, "it is important not to sell two tickets for the same seat," Lok said.

Not to worry. ACT's Tandem Computers, Inc. Himalaya system doesn't choke on 2,000 simultaneous ticket requests. "It gives us data integrity, fault tolerance and lots of processing power," Lok said.

The special characteristics of high-volume, time-sensitive ticket sales have turned out to be a good fit for unreliable parallel processing systems.

Follow the ticketing road

Ticket sales are "a leading indicator" of where many applications are heading, said Jim Johnson, chairman of The Standish Group International, Inc. in Dennis, Mass. "It's just a faster and faster world we live in,

and parallel processing for mission-critical applications is becoming more and more of a requirement."

ACT sells its ticket software to other organizations, some of which have also opted for parallel processing systems. El Corte Inglés in Madrid has run ACT's ticketing software on a Tandem machine for the past

four months, using it to sell 160,000 tickets to shows and bullfights across Spain.

According to Enrique Garcia Casas, IS manager, the company's system replaced many local and mostly manual systems.

"The advantage is that now we can sell tickets all over Spain in one system and have the data consolidated onto one machine," Casas said.

The Toronto Blue Jays organization uses a Tandem computer in its in-house ticketing system, and the baseball club may soon migrate to the Tandem-based ACT system. "Availability is critical," said Hans Fraenkel, manager of information systems at the organization. A ticket sale postponed be-

cause of downtime may be lost forever, he explained.

Fraenkel said the Blue Jays' two-processor Tandem CLX 820 can easily handle peak loads, even on the day season tickets go on sale. "And scalability is always there; tons of headroom is there," he said.

Peak performance

A Himalaya with 16 processors can spawn 400 "instances" of a program running in parallel at times of peak demand, Lok said. The machines run order processing software written by ACT in C and C++ that is optimized for parallel processing.

The computers also run Tandem's Non-Stop Kernel operating system and the Non-Stop SQL database management system.

ACT, a \$5 million start-up based here, specializes in systems for selling theater, sports and concert tickets and administering the databases of attendees maintained by event organizers. Smaller organizations with mostly local sales can run the company's TicketNet software to run on an Intranet LAN with a Windows NT server.

ACT has about a dozen Tandem servers and about 40 NT customers, Lok said. Most are in Europe and South America, but ACT is aggressively pursuing Canadian and U.S. customers.

New Products

PlanVision's flat-panel monitor

PixelVision Technology, Inc. has introduced a flat-panel monitor, Model PV116SX.

According to the Acton, Mass., company, the 16-in. display is 3 inches deep and can replace a CRT monitor of any size and any resolution without changing the existing system's software or hardware.

PV116SX features high contrast and brightness, on-screen menu controls, 128 by 1,024 resolution and a color palette of 2 million colors.

It is also available in finger- and pen-touch input versions.

Pricing starts at \$9,850.
► **PixelVision Technology**
(508) 264-9443
www.pixlevision.com

SAS Institute, Inc. has announced Scalable Performance Data Server, a high-speed parallel processing data server.

According to the Cary, N.C., company, the product lets companies with large amounts of data build data warehouses that quickly analyze and deliver information to users. It is a multiuser server that can be used to store SAS data sets, views and catalogs as well as indexing alternatives.

Scalable Performance Data Server is licensed on an annual basis with fees determined by server size. First-year fees start at \$25,000.

► **SAS Institute**
(919) 677-8000

Panasonic Computer Peripherals Co. has introduced PanaSync S21, a large-screen color monitor, and PanaMedia PM17, a multimedia monitor.

According to the Secaucus, N.J., company, PanaSync S21 has a 20-in. viewable image size with 1,600 by 1,200 maximum resolution and 0.25 arc sec dot pitch. It includes eight preset timing modes and 12 user memory modes. It costs \$1,099.

PanaMedia PM17 has 3-W speakers built in to the monitor for multimedia capabilities. It has 1,280 by 1,024 resolution with anti-glow, anti-reflection and anti-static characteristics. It also has an on-screen display menu that lets users customize the size, geometry and color of the picture in different

languages. It costs \$729.

► **Panasonic Computer Peripherals**
(201) 346-7000

Winchester Systems, Inc. has announced an upgrade to its FlashDisk RAID product.

According to the Woburn, Mass., company, FlashDisk RAID uses an Intel Corp. 486-based caching controller with up to 32MB bytes of cache RAM to deliver up to 6,000 I/O operations per second. It holds up to five disk drives, with a total capacity of 21.5G bytes. The FlashDisk RAID upgrade has redundant power supplies that can be hot-swapped from the front of the unit without shutting down the storage array or server.

Pricing for the FlashDisk RAID upgrade starts at \$11,467.

► **Winchester Systems**
(617) 933-8500

Product short

Pinnacle Micro, Inc. announced Tahoe 640, a 3.5-in., 640M-byte removable optical drive. It can store up to 640M bytes of data on a rewritable disk and is compliant with the major International Standards Organization, American National Standards Institute and ECMA industry standards. It costs \$799. Removable cartridges cost \$99 each. Pinnacle Micro, Irvine, Calif. (714) 789-3036, www.pinnaclemicro.com.

Sterling answers storage management call

By Jai Kumar Vijayan

Storage vendors are responding to growing user demand for centralized management of distributed multiplatform storage operations with a spate of new products. The latest is Sterling Software, Inc.'s Samis: Expert

3.0 storage management software for Unix, Windows NT and Novell, Inc. NetWare environments.

Samis: Expert 3.0, which is shipping, lets administrators centrally monitor and manage storage subsystems in each of the three operating system environments. It

does this by combining a centralized view of the network with online, interactive reporting.

The product automatically scans the entire storage system at user-defined intervals and generates information about the kind of data that resides on it, where it is stored, who is using it and how and when it is used. All of that occurs from one central point, said David Halpern, product marketing manager at Sterling in Sacramento, Calif.

More for your money

This kind of management capability aims to help users reduce storage management costs and improve capacity planning for hardware and labor.

"What it gives me is a tremendous amount of [storage management] information that I wouldn't have been able to generate on my own," said Charles Magrude, resource administrator at Attorney's Title Insurance Fund in Orlando, Fla. This makes it easier to manage storage devices across the enterprise, he said.

Prices start at \$17,500 for a dedicated Windows-based application server and a five-node Windows NT or NetWare license. For Unix environments, pricing starts at \$20,000.

Similar products with varying degrees of management capabilities are available from vendors such as IBM, Legato Systems, Inc. and Cheyenne Software, Inc.

Attorney's Title Insurance, a beta-tester of Samis: Expert 3.0, is currently migrating applications of mainframes to a distributed Windows NT and NetWare environment. "I

Sams: Expert 3.0 supports

CENTRALIZED MANAGEMENT ACROSS MULTIPLE PLATFORMS:

Lets administrators manage storage without moving from application to application or server to server.

ONLINE, INTERACTIVE REPORTING: Helps identify what data is stored, where it is, who uses it, how it is used and when.

CROSS-PLATFORM QUERIES: Data can be managed consistently. Administrators don't have to write individual queries for each platform.

don't need to learn all the underlying stuff to get the information I want. Point and click it all takes," Magrude said.

Automatic deletion

With a Windows-based graphical user interface, Samis: Expert 3.0 also allows administrators to manage storage devices across undetermined thresholds. When the software detects a problem, it automatically initiates user-specified storage tasks to correct it.

For instance, when a server exceeds its space threshold, Samis can be programmed to automatically delete all temporary files on the server. Online status views give administrators information on obsolete or unused files that can be deleted if necessary.

Briefs

HP links deal

Hewlett-Packard Co. in Palo Alto, Calif., has signed a marketing and development deal with Insignia Solutions, Inc. in Andover, Mass., to use Insignia's NTriuge server to let HP workstations and X terminals user run 16- and 32-bit Windows NT software.

Bull charges in

Gruppo Bull is making its PowerPC-based Sagitar Unix clusters available in the U.S. The Sagitar line, which links up to eight of Bull's four-processor servers, was introduced in March but had been limited to the European and Asia/Pacific markets. The clusters support up to 5,000 active users and can be preconfigured with software from vendors such as SAP AG and Oracle Corp.

Unisys' Aquanta servers back in summer sun

Unisys Corp. in Blue Bell, Pa., has announced its Aquanta series of servers for World Wide Web and intranet applica-

tions that use the Solaris operating system from Sun Microsystems, Inc. The products, to be rolled out this summer, include an Aquanta Internet server, an Aquanta Security server with firewall software and an Aquanta Application server for client/server networks. Pricing for the servers, which use Intel Corp. Pentium or Pentium Pro processors, wasn't available.

A Sequent deal

Sequent Computer Systems, Inc. in Beaverton, Ore., has signed a deal to bundle Open Market, Inc.'s Web servers with its Symmetry 5000 hardware.

Compaq has simpler lineup

Compaq Computer Corp. in Houston plans to drop its low-end ProLine line of corporate desktops. It will standardize on DeskPro as the brand name for its business-class PCs. The firm recently began its brand consolidation when it announced two corporate lines under one name, Arista. Compaq will do the same for the corporate desktop when it introduces a line of DeskPro that will span from an entry-level model priced near \$1,500 to high-end Pentium Pro systems, sources said.

The future of
MOORE'S LAW

AND OTHER INSIGHTS FROM
ONE OF THE FOUNDING FATHERS OF
THE MICROELECTRONICS INDUSTRY

Gordon Moore
Chairman of the
Board, Intel Corp.

Can Moore's Law continue indefinitely?

Probably not, says Intel Chairman and Co-founder Gordon Moore. Technical and business limitations will soon present real problems to the "law" that states chip density doubles every 18 to 24 months. Falling off the curve has implications for everyone in the silicon food chain, including IS managers who count on rapid systems upgrades to drive business.

At the Computerworld-Smithsonian Monticello Lectures on May 1, Moore spoke on the past, present and future of the microchip, the electronics industry and Moore's Law. This article is excerpted from his lecture and from an interview with Leadership Series Editor Bruce Raynor.

There is nothing natural about Moore's Law. It emerged from the work of people developing dramatic new technologies, products and processes. And there is nothing sacred about the 18-to-24-month time period between generations of microchips. The relentless pace of chip development has to do with many different factors. Among them: having access to a lot of capital, moving research and development close to the manufacturing process, creating open organizations where innovation can flourish, accepting change as a constant and, of course, having a healthy

dose of luck. Indeed, these are the factors that have shaped Silicon Valley over the last four decades.

But there is another, more fundamental driver of Moore's Law, according to the man himself. "More than anything, once something like this gets established, it becomes more or less a self-fulfilling prophecy. The Semiconductor Industry Association puts out the technology road map, which continues this generation [turnover] every three years. Everyone in the industry recognizes that if they don't stay on essentially that curve they will fall behind. So it sort of drives itself. Until we get to the point where, for some reason or another, no matter how hard we try we can't do it anymore."

What will stop the silicon freight train? Moore, who in 1965 first identified the relationship between time and the number of transistors on a microchip, has two fundamental concerns about staying on the curve. First, there are business limitations. As chip density rises, the cost of production rises almost exponentially. Second, there are real physical limitations. Problems arise as chip design gets down to the atomic level.

Will a new technology, or combination of technologies, provide a solution? Moore doesn't think so. "It is always presumptuous to say 'forever,' but I don't see anything that is going to come along that will replace [microelectronic] technology."

"Maybe I'm just getting old, but my view is that the technology that's developed around silicon was a general-purpose technology for making microstructures of materials. I think it's extremely unlikely that some kind of biological assembly process, to pick an example, is going to be able to make the same kind of products, and therefore, re-

ally be a substitute technology."

If that's the case, how much longer can the semiconductor industry sustain exponential growth in the complexity of successive generations of integrated circuits? "I think much of the rate of progress can be expected to continue for at least a few more generations. Three generations of technology at three years per generation is about a decade. So I can see us staying on roughly the same curve that long."

Business limitations

"What concerns me more than approaching physical limits — and there are real physical limits as eventually the atomic nature of matter really starts to bite — is the fact that the cost of the technology seems to be growing exponentially as well. This doubling of the cost about every generation is something that is going to be hard to continue. It will be hard to stay on the same kind of curve that we've been on previously."

Cost of equipment. "When Intel started [in 1968], we raised \$3 million. That let us equip our first factory, develop new technologies and develop our first products and get them to market. Now one of our larger factories that does just the wafer processing — it doesn't even do the assembly and test — costs about \$2.4 billion when they're full of equipment. We also have smaller factories that cost

\$1.5 billion. [These new factories] don't last very long because of the [rapid evolution of] technology."

"Back in 1968, a piece of manufacturing equipment — a bank of furnaces or a photo lithography tool or whatever — cost about \$12,000. It varied a little bit, but that's a pretty good approximation. The number now is about \$6 million — a 500-fold increase in the cost of a piece of equipment."

"Intel's revenue per employee has grown from about \$64,000 [in the mid-1980s] to \$437,000 last year, a sixfold improvement. But it's a darn good thing it did because our capital investment per employee grew from \$68,000 to \$274,000, or about fourfold. That's a pretty darn capital-intensive business."

"If you extrapolate the history of the last few decades, the cost of a factory has about doubled every technology generation, and it doesn't show any sign of rounding off. If you double that for even two more generations, you arrive at \$10 billion factories. That is a rate of increase that is awfully hard to swallow."

"I don't think we can do that for two more generations. Of course, two generations ago, I wouldn't have considered the \$2.5 billion factory viable, either. We are getting to the point where

You have to accommodate the past.
Prevail in the present. And remain
flexible into the future. Feel any pressure?

What computer company do you work with?

You should be working with Hewlett-Packard, a company that knows how to make client/server solutions work in the real world. Over the years, HP has helped thousands of companies successfully transition to flexible open enterprise computing. And we can do the same for you. If the business decisions are yours, the computer system should be ours.

Hewlett-Packard Computer Systems

 HEWLETT
PACKARD

COMPUTERWORLD Leadership Series

After sending the first simple integrated circuit into production in 1961, Moore called his lab staff together to discuss what technology they'd tackle next. "We had no appreciation that we had just turned over the first stone in this huge quarry."

the cost of the factory, the depreciation cost and the cost of the investment is an increasingly large fraction of the total cost of building the integrated circuit. It is getting up to the percentage now that it is certainly not clear to me that we can keep doing it.

"A lot of the smaller companies, even some larger companies, are taking advantage of factories built by others. There are factories built in Asia whose charter from the beginning was to supply contract manufacturing.

"But I don't anticipate the major players moving in that direction. You might avoid the capital investment, but there are a lot of disadvantages to depending on other people's capacity. The only way you can be sure you have leading-edge capacity is if you build it yourself."

Cost of labor. "Intel's first microprocessor, [the 4004], which came out in 1971 and had about 2,200 transistors on it, had a gang of about 10 people designing it. Today, the generation we're working on, instead of 2,200 transistors, has about 10 million transistors, or about a 5,000-fold increase in the complexity of the chip if you measure it by the number of transistors. The size of the design team has gone from 10 people to 400 to 500 people, and the costs have gone up at least proportionally. If you plot it, it is pretty near exponential. Unfortunately, I see [this trend] continuing."

Physical limitations

The other major challenge the semiconductor industry faces is the physical dimensions of the chips themselves. As the number of trans-

The \$15 million dollar watch

It may be a microprocessor powerhouse, but Intel ushered the market on some key opportunities along the way, admits Moore.

Introducing the 4004. "The first object I ever designed was a microprocessor, and I thought it might be a computer. Only after I had designed it did I realize [Microfiche] had built the first one, although I was using it before the second one. So I thought,

"Well, I can't sell it as a computer, so I'll sell it as a timer. I'll sell it to a company that makes alarm clocks, and I'll call it a digital timer."

"And we were also one of the first ones out of the business."

The total investment in Intel's Microsense venture? About \$15 million, Moore estimates. He still sleeps on his vintage digital watch every day, keeping it as a reminder that not all business ventures will be as lucrative as microprocessors. "It has an alarm in it that wakes me up every morning."

THE HOME PC. The personal computer "was an opportunity that was presented to me [in the early 1970s], well before Apple [developed its first

COMPUTERWORLD Leadership Series

sitors rises, so does the complexity of the design, the size of the transistors, manufacturability and so on.

Transistor dimensions. "It looks like the transistors themselves face some problems with minimum dimensions on the order of 0.05 micron." Right now, the industry is moving toward 0.25 micron technology for mass production.

"If you can operate at increasingly lower voltage levels you'd be OK, but people are concerned with going below something like one volt. I think that practically now, the people in the industry would generally agree that a minimum dimension of around 0.05 microns starts to cause some fundamental problems with devices.

"The [integrated circuit] industry tends to go in steps of about a factor of 0.7. So if we are looking at 0.25 micron as the next generation, then a few years later we'll be at 0.18 micron [approximately 0.25 micron times 0.7]; then a few years after that, 0.13 micron [approximately

0.18 times 0.7]. If you stayed on that path, we've got another two or three generations after 0.13 before we get to 0.05 micron." If each generation takes about three years, then it will be 12 years before the industry faces the 0.05 micron barrier.

X-ray lithography. "Now, there are some intermediate barriers that we have to contend with. One of them is ordinary optical lithography." (Optical lithography is the technology that chip makers use to produce the device pattern on the silicon wafer.)

"Ordinary optical lithography systems can go down to 0.13 microns. But to get below that, you move into X-ray region. X-ray or 'extreme ultraviolet' lithography is a major change for the industry. It will require completely new equipment. So X-ray lithography has got a lot of investment ahead of it."

"I think to avoid [technical] problems, people will come up with a hybrid approach to lithography, where you only use [X-ray lithography] for the finer

structures in a small portion of the device and then [use] regular photo lithography for the rest [of the chip]. I think there's going to be some kind of a discontinuity, though."

What next?

Barring a replacement technology, Moore's Law has until about 2010 before it comes up against a brick wall, Moore says. What then? Will product development begin to slow? Will the cost of successive generations of technology rise instead of fall, as it has over the past three decades?

A lot depends on technology innovations over the next few years. But it wouldn't hurt for business leaders to start thinking about the consequences of the end of Moore's Law. ♦

Gordon E. Moore, Ph.D., 67, is chairman of the board at Intel Corp. A pioneer in the microelectronics industry and co-founder of Intel in 1968, he received the National Medal of Technology in 1990 from President George Bush.

model]. An Intel engineer came up to me and suggested that we could make a computer for the home using the microprocessors that we were doing then. But the only application he could suggest was the home with her recipes.

"I couldn't see my wife sitting at the stove pushing numbers into a PC, and so we decided that it's not a product that would ever go anywhere."

DRAMs. "We missed some opportunities by poor judgment: The dynamic RAM business, for example, which was the product that really got (Intel) off

started. In the early 1960s, we kind of dabbled on a couple of microprogrammable generators and lost our leadership position.

"And suddenly in the [memorandum] industry happened to 1968, where we were positioned right to jump back. Into a leadership position, we looked at the investment that was required and

decided we would have to build a couple of new plants. At that time, [the investment] would have been about \$400 million. And since the whole industry was moving money to that investment, we didn't see it as a good return. "So in spite of having done the development of both the technology and the product, we abandoned DRAMs."

Fast. Two built-in Fast/Wide SCSI 2 channels deliver maximum data transfer speeds all the way up to 40MB per second.

Faster: The internal PC has more bytes around at a greater L2MM per second.

Result: $1.1 \times 256MB$ per second.
That's the speed you'll get out of the processor-to-second-level cache.

Apple Network Servers don't run any old UNIX® operating systems. They run 200% reliable, validated strength AIX® operating systems.

*Not just any two-year cooking
time are big enough.*

With support for both TCP/IP and AppleTalk protocols, you get fast network speed when you have either PC or Macintosh™ systems (or both) connected. Of course, being Apple we couldn't resist buying AppleTalk for maximum speed.

Add a PC RAID disk array card and your Network Server supports up to six hot-swappable drive bays. So your server doesn't have to go down just because one of your drives dies.

With a modular processor daughterboard, upgrading for microprocessor in your Network Server is a snap.

Each major component of the Network Server 700 can be accessed in about the time it takes to read just a few of these captions—50 seconds or less.

Add up to six PCI cards — Ethernet, FastEthernet, PCI RAID disk array (with four of these, sorry!) or a SCSI array of fixed-pitch PCI cards — via the PCI board. There are open slots.

Choose from two models: the Network Server 500 and the Network Server 2. As usual expect, the Network Server 2 offers more shared and enterpriseable

Buying a power supply doesn't have to mean buying power. Simply consider all it takes to replace either one of the two optional hot-swappable, redundant power supplies you get with the ThinkPad Server 300.

Software

Replication heats up

By Dan Richman

Replication, a way to copy data changes among locations, is one hot technology.

Barely on most users' radar screens just two years ago, replication technology is doubling in sales every year and is growing more than twice as fast as the overall market for relational database management systems (see chart). Still, it is a relatively new market, so there are comparatively few cus-

tomers. But those who have replication in place say they couldn't do without it.

That explosive growth mirrors the increase in the size of databases and the trend to decentralize data among numerous end-user sites, users and analysts said. In the U.S., the average site's data storage capacity is growing by 90% each year, according to International Data Corp. (IDC) in Framingham, Mass.

Replication is "a simple

way to spread data around in real time. The biggest growth is in keeping workgroups updated from headquarters," said Steve Hendrick, a research director at IDC.

"We just couldn't survive without replication," said Mike Johnson, senior database administrator at Access Health, a phone-in health advice service in Roanoke, Calif. Access Health maintains identical 1400-byte Oracle Corp. databases of 8 million

patient records at offices in Phoenix, Chicago and Sacramento, Calif. Every nurse must be able to access each patient's history and know what the last nurse advised the patient.

So Access Health installed Oracle replication technology in April, when it eliminated its Novell, Inc.-based system. The system allowed replication, but it couldn't handle the growing database and failed once or twice a day, Johnson said.

Convenient backup
Replication is also a convenient way to provide a "hot standby" backup database in case the principal database crashes.

"We use replication to keep in sync our two Oracle 7.2.2 servers, which handle order processing and customer-service records," said Warren Bernard, a senior manager at Network MCI Services Corp. in Richardson, Texas. Calls to 1-800-MUSICNOW, a service that allows the auditing and ordering of music CDs by phone, are answered and serviced by an automated voice-response unit. Orders are fed to an unoccupied server, then replicated to an

Project management goes enterprise-wide

By Lisa Picarile

Project management may be a tried-and-true corporate application, but its fire is changing. The Internet and other factors are helping project management to link with other kinds of software and broaden its use.

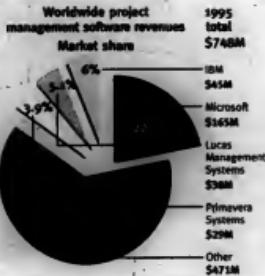

Worldwide sales of project management software are expected to grow 10.6% annually and reach \$1.2 billion by 2000, according to Judy Hodges, a senior analyst at International Data Corp., a market research firm in

Framingham, Mass. Last year, worldwide sales were \$748 million, 70% of which came from the U.S.

"Project management is no longer an isolated application," Hodges said. "Now it can be integrated into other areas of the business — human resources, sales and marketing, accounting." Project managers can see the impact that projects and associated costs will have across the business.

Another factor in project man-

agement, page 55

SOFTWARE FOR
CHANGING WORLD

Analyze data from any database?

End users

On their own? An to go to lunch,

Time. To do your job. To think. To actually take lunch. With Lotus Approach[®] time is what you'll be giving the entire MIS department. Because Lotus Approach is a powerful, easy-to-learn database that enables end users to manage and analyze corporate information on their own.

In fact, Lotus Approach is so easy to learn, your users can actually be productive within a few hours of opening the box. Which means rather than tapping you on the shoulder every five minutes, they can tap directly into your corporate data themselves. That's the beauty of Lotus Approach.

Just imagine end users creating professional reports without you having to hold their hands. Business analysts building their own charts and crosstabs. Users with no programming experience at all generating completed business solutions in seconds using Approach's new SmartMaster[™] applications. And you actually having the time to ponder the dessert menu.

With Approach, it doesn't matter where your data is stored. In DB2[®], Oracle[®], Sybase[®], dBASE[®] or almost anywhere else. Approach works with your data as it is, and where it is. Users can even join related data from different database systems. Which means that users never need to copy or convert data into yet another database format just to build reports and analyses.

Further proof that Lotus Approach is the right choice for your users: Lotus Approach 96 just won PC Magazine's "Editor's Choice" award, prompting one reviewer to say, "If there's an effective database product that surpasses all others in ease of use, it's Lotus Approach." We couldn't have said it better ourselves.

There's a lot more Lotus Approach can do, which means there's a lot more time for you to do what you'd rather do. To find out more about Lotus Approach 96, or if you're a DB2 user looking to "Extend the Power of DB2," call 1-800-TRADE-UP, ext. B994. Or visit us on the World Wide Web at www.lotus.com.

In Canada, call 1-800-GO-LOTUS. ©1996 Lotus Development Corporation, 35 Cambridge Parkway, Cambridge, MA 01242. All rights reserved. Lotus, Working Together and Lotus Approach are registered trademarks and SmartMaster is a trademark of Lotus Development Corporation. Users struggle to keep track of Java definitions

By Frank Hayes

What's in a name? For corporate users of Java, just figuring out why one Java program is called an applet and another is an application is a head-scratcher.

"I think the difference between an application and an applet is unclear to everybody except people who have started programming in Java," said Larry Hagerly, a Java senior systems analyst at GTE Data Services, a subsidiary of GTE Corp., in Tampa, Fla.

Java is Sun Microsystems, Inc.'s programming language that was designed to let the same program run on many different computers and other devices. Java has been widely touted as a way for large organizations to write applications that run across the Internet or corporate intranets.

But Java can be used in many ways. "For example, 'We're going to do this in Java,'" said John Swart, a Java developer, an information consultant at Eli Lilly & Co. in Indianapolis. "But sometimes they mean JavaScript, sometimes Java, sometimes applets. Sometimes I don't think they know what they mean."

A Java applet is prevented by the Web browser from accessing a user's system resources and files.

A Java application can access files and resources and establish network connections.

To nonprogrammers, Java usually means an applet: a Java program that is downloaded as part of a World Wide Web page and runs within a Java-enabled Web browser. Java security features "block applets from gaining access to users' files or causing other problems."

"The word applet doesn't mean it's a small program," Hagerly said. "We're creating some large-scale Java programs now, but they're applets because they run in a browser."

A Java application is a Java program that runs outside a Web browser and isn't intended to be downloaded on the fly across the Internet. Java applications can access files and make multiple connections to networks — things applets can't do.

JavaScript isn't really Java at all; it is the scripting language used in Netscape Communications Corp.'s Navigator Web browser. And Sun and other vendors are creating extensions to Java called Java Beans, as well as additional Java programming libraries.

Confusion continues

Developers are struggling to keep track of all the new Java terms, classes and add-ons. But the speed at which vendors are serving up Java guarantees continued confusion among information systems managers and even some developers — at least until they gain more experience with the language.

"It's like you're on a treadmill that's running full bore," Swart, a Java developer, said.

"I think it'll sort out eventually," Hagerly said. "But it's going to be hectic for the summer."

New Products

Magic Software Enterprises, Inc. has announced Magic 7.0, a rapid application development (RAD) system.

According to the Irvine, Calif., company, the product was designed for RAD across the Internet. Windows 95 and Windows NT. It lets users reuse templates, provides rapid feedback and immediate access to tables and application modules, and provides reusable developer and end-user functions.

Magic 7.0 includes enhanced support for the development of multilingual applications, which lets developers build one user interface for all supported languages. It includes a WebLink utility that lets developers create Internet applications.

The product supports Microsoft Corp.'s OLE 2.0. Pricing for a single-user Windows development network system starts at \$2,500.

Pragis Corp. has announced WinMap Software Developers Kit.

According to the Bellingham, Wash., company, WinMap Software Developers Kit lets developers and programmers create geo-

graphic viewing and querying systems on a PC without having to learn geographic outline (polygon) coding. It is a database-independent product with display enhancements, including customizable bit maps, icons, menus, fonts and cursor.

The kit includes a Dynamic Data Exchange/OLE-supported database engine for spatial relationships, import tools and features that create base maps from a variety of graphical data sources.

Pricing for WinMap Software Developers Kit starts at \$5,000.

CENTURA

PRODUCTS MAKE CARS MOVE FASTER FOR

MERCEDES-BENZ® CREDIT CORPORATION.

Using Centura Software Corporation's powerful client/server software, Mercedes-Benz® Credit Corporation created an asset management application that helps cars coming off existing leases move out to customers three times faster.

MBCC looked at a number of development environments, but only Centura offered an easy-to-use solution with enough power and flexibility to develop all the functions we wanted within the application.[®]

— Peter Atiles, Manager,
Application Development, MBCC

Featuring powerful tools for rapid application development, team programming, connectivity and remote deployment, Centura's products enabled Mercedes-Benz Credit Corporation to create a complex application that integrates corporate mainframe data and runs on PCs at more than 200 dealerships across the U.S. Of course, the important thing to the dealers is that the application gives them instant access to the information they need to stay competitive — and sell cars faster than ever before.

Take A Free Test Drive.

So call today for your free test drive of our new Centura product line. After taking our new model for a spin, we're sure you'll realize what over 1.5 million users have already learned: Centura products are engineered like no other software in the world.

New dimensions

Most observers agree that project management will take on new dimensions over the Internet — and vendors are working to change their software to allow that.

Primavera Systems, Inc. in Bala Cynwyd, Pa., is streamlining the process of posting project management data on intranets by creating project management templates that are already in HyperText Markup Language format, company officials said. The company is also developing Java applets that will automatically send data and information to those involved in projects. But the officials wouldn't specify when this will happen.

For its part, Time Line Software Corp. in Bellevue, Wash., plans by this month to have a Java-based intranet client that will act as a front end to its project manager.

Customizing projects

Microsoft Corp. is taking a different tack by providing tools that let users extend and customize their project management package. Jess Cio, group project manager for Microsoft Project, said workgroups can be more closely tied in to project management by better integrating Project with Microsoft Office.

For example, users can extend Project's capabilities via integration technologies, including OLE, ActiveX controls, Visual Basic for Applications and Microsoft's BackOffice, Cio said.

Project management

CONTINUED FROM PAGE 51

agreement's popularity is the increase of PC-based packages. Traditional users have been mainframe-based aerospace engineers and others who have had project management as part of their titles.

Now, project management is considered easy to use and able to provide the depth of features previously found only in mainframe software, said Chris Le Toq, an analyst at Datapoint, a market researcher in San Jose, Calif.

"The typical user is someone like a marketing manager who has several things to oversee at once," said Mike Webb, president and CEO of Time Line Solutions Corp., previously part of Symantec Corp. and a project management vendor.

Some project management

packages are moving from tracking individual tasks to looking at an entire project's scope and determining what kinds of resources it will require.

This makes it even easier to do enterprise-wide project management. "I have to be able to look across 60 to 80 projects simultaneously and know what my capacity is to take on other projects," said Paul Micci, scheduling administrator at Air Products & Chemicals, Inc. in Allentown, Pa.

Internet differences

Another big change has been the Internet. Time Warner Cable Full Service Network, a division of Time Warner, Inc. in Orlando, Fla., is implementing an intranet to help manage a 15- to 20-year project that will put interactive television into homes.

"We will have the knowledge at

our fingertips to automatically transfer resources between projects," said Dan Rexroad, manager of process and method at Time Warner Cable. Because the information is posted on the intranet, the 50 people involved in the projects can see what resources are available and what is going on, he said.

Most analysts agreed that the Internet will foster even greater use of project management but said software will have to change to accommodate it (see story at left). "Better integration of scheduling and scheduling systems that automatically update project plans are a natural extension, particularly down the road," Le Toq said.

He said he envisions companies using intranets for better project management with their customers — lawyers making their appointment books available to key corporate clients, for example.

Replication

CONTINUED FROM PAGE 51

other within 10 sec.

"If one goes down, replication technology keeps checking whether it's back up," Bernard said. "If it is, it gets automatically updated. Without this, it would be a very large pain in the neck to do business — or I couldn't do it at all."

The major RDBMS vendors offer replication. But there are differences among the offerings to address:

- Type of replication offered. Some vendors provide update-anywhere replication. This lets any copy of the database be updated and sends changes to all other copies. It creates the potential for conflicting changes, which can be dealt with by a feature called automatic conflict resolution.
- Data cleaning. IBM claims this

summarizes, translates or otherwise modifies data while replicating it.

• Where the replication code resides. Informix Corp. integrates replication code into the kernel because it claims that cuts I/O overhead. Others maintain separate engines on the grounds that they are more flexible.

• Heterogeneity. The ability to replicate data among two or more dissimilar DBMSs. Vendors' capabilities and pricing vary.

Glossary

• **Replication:** The periodic copying of changes in data, often involving multiple tables, to one or more remote databases.

• **Primary-Site Replication:** Only one database is updated; changes are sent to one or

more remote copies of the database.

- **Fuller Replication:** A type of Primary-Site Replication in which a single remote copy of the database is used only as an emergency backup.
- **Update Anywhere:** Any database can be updated; changes are sent to all other copies of the database. Potential exists for conflicting changes.

IBM

Stations for a small planet

Moving beyond the help desk

By Bob Francis

The corporate help desk is getting some company.

New software links the help desk to systems management tools and the Internet, bringing some new functionality beyond

just telephone-line support.

These links are meant to give systems and network managers better information on how their systems are operating and give help desk managers recent data on new systems and applications.

"Most help desk systems operated sepa-

rately from system management functions in the past," said Jack Gold, an analyst at Meta Group, Inc., in Boston. "In many cases, they were duplicating efforts."

For instance, when a company downloads software from a server to a PC, the information is available in the LAN manage-

ment tool but often isn't available to help desk workers because the two databases aren't linked. Many of the latest releases of help-desk software link the two databases.

Two systems management companies adding these links are McAfee Associates, Inc. and Platinum Technology, Inc.

Help over the 'net

Vendors are adding Internet capabilities to help desks

COMPANY **PRODUCT** **FUNCTION**

McAfee Associates	Vycon	Web gateway to Vycon Enterprise database
-------------------	-------	--

Platinum Technology	Apricot Hand-Free Support	Help desk support through the Internet
---------------------	---------------------------	--

Platinum Technology, in Oakbrook Terrace, Ill., has added support for Hewlett-Packard Co.'s IT/Operations management framework to its Apricot help desk tool. IT/Operations managers can send and receive messages and alerts to and from Apricot and can pass information among Apricot and other Platinum Technology systems management tools.

McAfee, in Santa Clara, Calif., purchased Vycon Corp. in College Park, Md., earlier this year. McAfee has integrated Vycon's help-desk functions into its Saber management products and its Saber LAN Workstation network management suite.

More capabilities

Integration with Vycon's products gives help desk workers access to Saber's distribution, metering and inventory functions.

"This way, what we know — often up to the minute — what application should be available on a user's desktop, so we're working with better information," said Robert Spears, help desk manager at Bank of Boston.

The two products also support Internet access to help desk databases. McAfee has added Vycon Web, a system based on Microsoft Corp. Windows NT Server that gives users access to the Vycon information database and to trouble tickets. Apricot also supports Internet access to its database.

McAfee's Vycon Enterprise 3.1 is available now and costs \$15,000 for 10 help desk operators. Platinum Technology's Apricot costs \$37,500 for 10 users and is available now.

"Computerworld's Custom Publications Program helped us successfully communicate Novell's key business messages to the right audience."

"As a media and marketing communications agency, The Martha Felt Group is always looking for innovative ways to meet our clients' communications needs. To best help Novell tell the world about its products and services we decided an insert would offer the best advertising real estate for the money.

And we were right. Computerworld's Custom Publications Program gave us the flexibility to craft and distribute a publication that was both informative and insightful. Computerworld took care of all the details and provided us with an appropriate media vehicle that focused on our client's target audience.

In addition, this publication was successful in highlighting the contributions of Novell's partners in helping Novell deliver complete solutions to customers.

And talk about marketing muscle. Novell and its partners are using the publication for direct mail purposes, in sales kits and as an effective marketing tool at various trade shows and events.

If our client is happy, we're happy. With Computerworld's Custom Publications Program, everybody wins!

Carrie Gayhowski

We give the world's top CIOs client/server/web applications, a secret weapon, and a strange aversion to cameras.

So you're looking to build the next generation of client/server applications. And give your company a major competitive weapon. Well, these days,

some of the world's best CIOs are doing just that. And putting them to work on the web.

It's more than home pages.

When most people think of the web, they think of static pages. Brochureware. Not the kind of applications you'd expect to have a major impact on your business. But at ParcPlace-Digitalk, that's exactly what

VisualWave
Official secret weapon
of the Global 1000

we let you create—client/server/web applications—business-critical applications that actually run on the web.

Until now, the only way to build web applications was to use an

assortment of HTML, CGI, C, Perl, and SQL tools. In all, developers had to know at least five languages and five environments. But that was before VisualWave.

VisualWave. The first integrated solution. We designed VisualWave to give you an integrated development and deployment

*Business-critical
client/server/web
applications*

environment. Including database access, a web delivery system, and an Internet Application Server. And we based it on object technology, so you can build, deploy, and maintain applications at a

speed that keeps pace with your business.

You can even publish client/server Windows

applications directly on the web. Of course, VisualWave supports Java and ActiveX. And it runs on the 12 most popular client/server operating systems, as well as the industry-leading browsers.

Supports
Java applets
and ActiveX

So why the aversion to cameras? If you found a more strategic way to run your business, the fastest way to respond to change, and an integrated client/server/web solution, would you tell your competition

about it?

Maybe not. It looks like our customers don't want to give away any secrets.

either. So if you want to see exactly what VisualWave can do, call us at 1-800-759-7272. Or visit www.parcplace.com. And get the VisualWave white paper on building client/server/web applications.

Seamless
development
and deployment

ParcPlace

The Enterprise Network

Transmission technology revived for 'net

By Kim Girard

Asynchronous Digital Subscriber Line (ADSL) technology, once touted for video applications, is bouncing back as a powerful way for users to access the Internet.

Five years ago, the regional Bell operating companies were looking at ADSL, which offers broadband services over copper local loops for video on demand and other video-based services. But industry attention soon shifted to cable modems and fiber technology.

Today, the increasing number of remote users are demanding faster access to the Internet. This demand is reviving ADSL.

The players

BellSouth Telecommunications, Inc. in Atlanta plans to offer ADSL services by the middle of next year. AT&T Paradyne recently unveiled Rate ADSL, which lets carriers provide various transmission rates. Some other big players, including Alcatel Telecom, Cisco Systems, Inc., General DataComm, Inc. and NEC Corp., demonstrated ADSL products at SuperComm, a telecommunications show in Dallas last month.

"The resurgence is due in part — if not entirely — to everyone seeing Internet dollars," said Bob Gage, a broadband consultant at TeleChorus, Inc., in Vero Beach, Fla.

ADSL provides up to a 6M bit/sec. link to the user and a 640K bit/sec. link back to the carrier, offering a speedy solution for the last mile that is much cheaper than fiber. High-speed Digital Subscriber Line — another member of the DSL family — supports bidirectional 2M bit/sec. links.

"We think [ADSL] has potential," said Mike Randolph, plant manager at Community Service Communications, a local cable-access provider in central Maine. "We're waiting for standards. We're waiting for the price to settle down."

By the end of next year, the price for an ADSL modem should drop from the \$2,000 to \$3,000 range to \$250 to \$500, said Steve Sazegari, a principal at TeleMac in Foster City, Calif. In the long run, ADSL is an interim solution that fiber will replace, he said.

But it is a smart bet in the short term, said David Sobe, communication systems group vice president at Ariel Corp. in Cranbury, N.J.

"Copper works fine, and it's there," he said. "Why run fiber out to those neighborhoods for hundreds of millions [of dollars]?"

New NDS version tracks better

By Laura DiDio

When Novell, Inc.'s NetWare 4.11 ships later this summer, it will contain a slew of enhancements that will make its directory database much easier to use and manage.

The newest version of Novell Directory Services (NDS), code-named Green River, will contain a graphical management utility called NDS Manager that makes it simpler for administrators to monitor and track users, objects and resources across the enterprise and to quickly troubleshoot problems, said William Donahoo, Novell's senior director of product marketing. Another tool, the User Template Object, will let network managers set customized defaults and parameters as users and devices are added to the network, Donahoo said.

Early beta users of the new NDS features, such as Dan Blevins, technical analyst for microsystems and LANs at Hallmark Cards, Inc. in Kansas City, Mo., said the improvements to NDS are big money savers. Hallmark has 54 NetWare 4.1 network servers and 7,000 clients. About 80% are located at the firm's Kansas City headquarters; the rest are scattered throughout the U.S.

Novell's NDS Manager lets users manage and administer their network.

Fiber users eye FDDI switching

By Bob Wallace

The problems many users with FDDI backbone networks are running out of bandwidth but aren't yet comfortable with ATM technology.

The solutions: Migrate to FDDI switching, which is offered by the major vendors and doesn't require painful upgrades or retraining.

That's the path many users with Fiber Distributed Data Interface (FDDI) backbones are taking to boost

performance and squeeze a few more years out of their networks while they wait for faster Asynchronous Transfer Mode (ATM) technology to mature.

Worldwide sales of FDDI switches totaled \$212.5 million last year and will rise sharply this year to \$365.65 million, according to Dataquest, a research firm in San Jose, Calif. Sales will then gradually decline to \$309.8 million next year and \$227.7 million in 1998 as ATM is more widely deployed and Gigabit Ethernet emerges, a Dataquest study predicts.

"Users [who] moved to

FDDI in the early 1990s did so because they were the first to experience congestion in their backbone networks," explained Tom Nalle, president of CDI Corp., a consultancy in Voorhees, N.J. "It was the first and fastest response at the time. Now they're looking to switching to stay ahead of congestion."

That was the case with Air Products and Chemicals, Inc.

FDDI, page 62

Migrating to switching

Options for users with 100M bit/sec. FDDI backbone networks

Technology	Pros	Cons
ATM	• 155M bit/sec. and faster	• Immature technology
Gigabit Ethernet	• 1G bit/sec. • Based on original Ethernet	• Expensive • Products not available • Pricing not set • Not a standard
FDDI switching	• 100M bit/sec. • No painful upgrade • Offered by all major vendors • Moderate price	• Doesn't offer speeds as high as ATM

NetWhere? New NDS tracks better

CONTINUED FROM PAGE 61

lution time has been reduced to five to 10 minutes," he said.

NDS is considered the guiding light of NetWare 4.11 because it gives businesses a graphical picture of the entire enterprise and lets them centrally make moves, adds

and changes to remote and local NetWare LANs.

Until now, many NetWare shops delayed implementing some of the more advanced features of NDS because the directory database was so technologically daunting, said Patrick Bremen, network operations manager at Mercer Management Consult-

ing, Inc. in Boston. "To really get the most out of the earlier versions, such as NetWare 4.0, you had to be a Certified NetWare Engineer," Bremen said.

Overall, he said, Mercer Management's end users like NDS' ability to access other network resources regardless of where they are located. "It gives them flexibility and a feeling of teamwork," he said.

Jon Olttsik, an analyst at Forrester Research, Inc. in Cambridge, Mass., said the

improvements in NDS and the new features in Green River, including symmetrical multiprocessing and automated crash recovery for NetWare file servers, add much-needed functionality to NetWare. "Novell has given NetWare a body job and a new coat of wax. The new features, combined with the much improved ease of use, will make businesses think twice about abandoning NetWare for a wholesale migration to NT Server," Olttsik said.

FDDI switching

CONTINUED FROM PAGE 61

"We started with FDDI five years ago and found it to be a very solid technology and the only answer to our congestion problem," said Virgil Palmer, manager of computing and telecommunications infrastructure engineering at the manufacturer of specialty chemicals and industrial gases in Allentown, Pa. "But we found we needed more capacity on our backbone/network, so we installed an FDDI switch to support our 8,000-node network."

FDDI switching lets users such as Palmer break up their shared 100M bit/sec.

Bandwidth boosts
FDDI networks into smaller subnets with dedicated bandwidth. Air Products went from one large FDDI ring to 32 smaller rings.

Visitors recognized this user trend. 3Com Corp., Cabletron Systems, Inc., Cisco Systems, Inc. and several smaller players, including Xyplex Corp., all rolled out FDDI switching in their data center switches during the past year.

Fast, but slow to catch on

Anystar expected ATM, which offers speeds of 155M bit/sec. and faster, to be the next step for FDDI users. But the technology has been slow to catch on due to its high cost and slowly developing standards.

"We just weren't ready to commit to ATM," Palmer said. "This move doesn't preclude us from ATM, but we'd rather have someone else get burned on a new technology."

R. R. Donnelley & Sons Co. is another large user considering FDDI switching as an interim step.

"FDDI technology on the whole is smoother and more mature than ATM and offers as the network redundancy that we've had to have," said Bill Rachol, senior network engineer at the printed and digital information distributor in Chicago.

But not all FDDI users are moving to FDDI switching right now.

"FDDI is a real workhorse technology, which is crucial when the network is supporting clinical applications," said Jack Frost, network manager at Texas Children's Hospital in Houston. He said the hospital isn't moving to FDDI switching yet because the network isn't congested.

Frost originally went with FDDI because bandwidth-intensive applications were stressing the hospital's Ethernet and router network.

If you have any questions about our global capabilities,

The LAN, WAN monitoring frontier

By Patrick Dryden

The management of complex client/server networks should get easier this month for users of Remote Monitoring (Rmon) probes and analysis software from Frontier.

Software Development, Inc.

An upgrade to NetScout Manager performance monitoring software helps administrators watch traffic through switches on campus and frame-relay links across a wide-area network. New trend reporting

tools enable long-term evaluation of network performance.

And the multiport WAN probe can cut the cost and boost the efficiency of watching multiple WAN circuits, users and managers said.

Such improvements to the NetScout line get users such as Stephen Stought, a network specialist at Nationwide Mutual Insurance, Inc. in Columbus, Ohio.

"We need NetScout to figure out problems like slow response by a critical application for investing through stock purchase. When the price jumps before our purchase goes through, a few minutes' delay cost us thousands of dollars," Wright said.

Nationwide made bandwidth upgrades to network by segmenting, adding switches and guiding faster backplane. But that didn't solve the problem.

Printed circuit

Monter Software's JetScan Manager 4.1, available now, costs \$3,495 for a Windows 95 license and \$5,995 for Unix. The new probe ships at the end of the month at a cost of \$13,945 with four T1 interfaces; by comparison, a probe for one T1 link costs \$4,995, and dual probes cost \$16,995.

give us a call.

Whenever you hand us your most difficult telecommunications challenge, you have a lot of "uses" to choose from. We are, after all, in 120 countries—twice as many as anyone else—as befits a company with a million systems installed around the world.

And when we say we, we mean we. Each office is fully accountable, and capable of handling your global needs through a single point of support.

Which may lead you to ask, "So what? I don't even have business in Athens." Fair enough. But wherever you do have business, our global reach works for you in some very tangible ways.

It gives you access to our specialized "centers of competence" worldwide. It allows us to provide an unmatched breadth of products: PBXs, WAN solutions, wireless, video, call centers, CTI and more. And it means that, somewhere in the world, Siemens R&D people are developing more innovative, more practical, more open solutions 24 hours a day.

To find out more, call us at 1-800-ROLM-123, ext. 123. Visit our Web site at www.rolm.com.

Or, for a really personal view, take a tour of our offices. If you've got a year or two to spare.

Online survey details
how end users use the
Internet. 69

The Internet

Learn your lessons well

By Kim S. Nash

As intranet pioneers stake their claims and start building, they are generating a body of frontier lore from which other information systems groups can learn.

For example, Centura Banks, Inc. in Rocky Mount, N.C., found a way around a lack of funding.

It piggybacked supplies for its intranet — software, hardware and tools — on an external Internet banking project. Upper management already had put a high priority on the project.

The following are other ideas from those who have been there.

Security

Chrysler Corp.'s solution to what officials considered ineffective security methods was to leave some sensitive data out of an intranet application for car designers.

The system was built to help Chrysler engineers design better cars that cost less than the competition by estimating how much money Ford Motor Co. and other rivals spend on particular auto parts. But what isn't in the database is data about Chrysler's own spending.

"The last thing I want is that getting into competitors' hands," said Susan Unger, executive director of information systems at Chrysler in Center Line, Mich. "We have firewalls, but [our intranets] are not as secure as I would like."

Other users, such as Imperial Oil Ltd. in Calgary, Alberta, said intranets for accounting or strategic planning may require IS to double or triple the number of security measures that are used in other applications.

Culture

When Carole Franda faced the monotonous task of amending her company's corporate software development policy handbook for the fourth time this year, she broached the intranet idea with her boss. Such a "living document" would

save time and money, said Franda, a webmaster at Bell Atlantic Corp.'s Broadband Systems unit in Silver Spring, Md.

But her boss saw it differently. He approved her plan but requested that she produce the 100 hard-copy binders "just in case."

"The only way I could convince him that really would work was to just go ahead and build the thing and sit him down in front of it," Franda said.

Other users tell similar tales.

William Monroe, a webmaster at Harris Corp., an electronics company located in Melbourne, Fla., couldn't get the attention of his vice president.

But then Monroe decided to build a mini-intranet that included the executive's picture and memo he had written. The stunt saved Monroe's intranet project.

Living with Notes

The Lotus Notes vs. intranet debate divides many shops. Some have opted for

one over the other. Most shops say the two technologies can live together in peace. But it isn't easy.

Access Health, Inc. carefully considers when to use Notes and when to go for an intranet.

But unclear boundaries are "a major concern," said John Determan, a technical analyst at the health care information company in Rancho Cordova, Calif.

Application developers at Access Health use Notes to track projects and share documents. "They don't necessarily want to give it up," he said.

But now, IS is stricter about costs, justifying Notes. Determan said.

For other users, intranets are a welcome alternative to Notes.

Environment Canada, the environmental affairs division of the Canadian government, wanted to use Notes last year but couldn't because the cost of mil-

lerating corporate data from legacy systems to a Notes-ready format was too high.

But the Ottawa-based agency now is building an intranet for a natural resource engineering application, and Mike Reichling, a systems analyst at Environment Canada.

"Anyone with a Web browser can look at the data, no matter what platform is involved," Reichling said. Writing Notes instead of an intranet would have required outfitting all users with the software, he said.

Skills

Finding IS folks who can do the intranet job also can be a chore.

"Retraining employees is your best bet, many users said. Those workers already know the technical and political systems at the company,"

But sometimes intranet plans move faster than training programs.

Cheap labor

In that case, hire college kids or fresh graduates, advised the Texas Comptroller of Public Accounts, a state agency in Austin. "Our experience has been that most computer firms don't hire the skills. Your best source is kids — and you can hire them dirt cheap," said Stuart Greenfield, an analyst at the agency.

"[Our intranets] are not as secure as I would like."

Susan Unger, Chrysler

intranet that included the executive's picture and memo he had written. The stunt saved Monroe's intranet project.

Advice from consultants who have helped users design and build intranet applications

On starting out

A human resources system is a good intranet starting point, according to Harry Fenikoff, an analyst at Zona Research, Inc. in Redwood City, Calif.

Those programs are usually isolated from core business systems. Should something go wrong, no major catastrophes loom, Fenikoff said.

On politics

Intranet "ownership" is a big mess for some companies that have seen departments due over access to information.

To avoid some of the hassle, put intranet access points in public places throughout the company, advised Leilani Allen, a consultant at Texex Consulting, Inc. in Burlington, Mass.

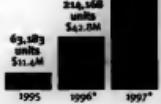

On juggling Notes and intranets

Don't automatically rule Notes groupware in favor of intranet systems or vice versa, said Doug Ryan, an analyst at Meta Group, Inc. in Stamford, Conn.

Intranets could take over some tasks, such as acting as corporate phone books, but Notes might be better for more complex applications, he said.

Mapping software heads in new direction

By Mitch Wagner

New Internet services are designed to help companies draw online maps to their business sites, using interactive technology to generate foot traffic in the real world.

Vicinity Corp., in Sunnyvale, Calif., today plans to launch a service that will let companies put customized street maps on their World Wide Web sites.

The Vicinity service competes with simi-

lar technology from GeoSystems Global Corp. in Lancaster, Pa.

For example, Payroll Magazine uses the GeoSystems service at its Web site (www.payrollmag.com) to draw maps of 1,500 theater locations nationwide.

Retail chain The Sharper Image uses the GeoSystems service to point out the location of each of its stores on maps at its Web site (www.sharperimage.com).

And Yahoo, Inc. uses the Vicinity service to build an online Yellow Pages of the San Francisco Bay area (sfbay.yahoo.com).

"All of our venues in the continental U.S. are mapped out through GeoSystems," said Andrew McGibbons, webmaster at Payroll. "A user can go in to [the Payroll site] and find out what's playing at a particular theater, go to a local map, find out where the theater is, and zoom in and out to find out what businesses are nearby," he said.

Each service lets end users log in to a corporate Web site where, for example, they can search for a map that shows the location of a particular store.

The corporate Web server passes the inquiry to a Vicinity or GeoSystems server, which builds a map of the location and passes it back to the end user.

Maps are mixed together with graphics from the subscribing company, making the maps appear to have been generated on the subscribing company's Web site.

Yahoo has built an online Yellow Pages of the San Francisco Bay area. The company uses interactive technology from Vicinity

The GeoSystems service costs \$6,000 to \$20,000 per year, depending on the level of traffic. Vicinity wouldn't comment on the cost of its service.

Well-received

"We get a lot of positive response from it," said Karl Sowa, a spokesman at Geo-Cities, a Web-hosting service in Beverly Hills, Calif. Geo-Cities offers the Vicinity technology as a feature for service hosting personal-home pages. "We get dozens of [electronic mail] messages a day from people saying how much they like it."

The Vicinity service, YourTown, is available immediately for maps of the continental U.S. Vicinity next month plans to unveil "proximity" searching to help end users find relative distances between given points, such as finding the nearest automatic teller machine to a given point.

GeoSystems offers three levels of inter-

Find it quick

Vicinity and GeoSystems have databases that provide the locations of more than 12 million businesses nationwide.

net service, MapQuest Custom Connect, available since late last month, is similar to YourTown because it allows subscribers to build "private label" maps on the Internet through a connection between the subscriber's Web site and MapQuest's site. That service is priced on a per-hour basis, typically \$6,000 to \$10,000 per year.

Another service, MapQuest Free Connect, also unveiled late last month, allows Web publishers to put forms on their Web sites and submit queries to MapQuest. They can submit up to five queries at a time for free.

A third service, MapQuest Interconnect, lets Web publishers link their site to the MapQuest site. When end users submit an inquiry, they are taken to the MapQuest site to view a map.

The cost of Interconnect is about \$12,000 to \$20,000 per year.

Turning to a new page

Tool links forms, Web sites

By April Jacobs

Career Corp. wants to write a new page in the \$3 billion electronic forms and documents market with Internet publishing software that integrates paper forms with World Wide Web sites.

Career in Los Gatos, Calif., plans to introduce a beta version of its OmniForm Internet Publisher later this month.

The product is aimed at government, health care and insurance industries, where customer interaction and paper flows are intensive. Other products, such as Xerox Corp.'s Textbridge, let users scan in documents and convert them to HyperText Markup Language (HTML) documents.

Improved format

Career's product uses its own Open Form Markup language, which is comparable to HTML but allows richer graphics and layout. Tom Koulouopoulos, president of Delphi Consulting Group, Inc. in Boston.

Beta-tester John Kelly, manager of the Electronic Storage Division at Kelly Computer Systems in Mountain View, Calif., said OmniForm can be used with electronic commerce and human resources, among other things. Kelly Computer provides sys-

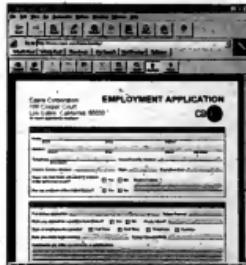

tems integration and forms design. "This Internet publisher is going to function quite well in that environment," Kelly said.

Also, a company could develop a page to let users order a product and use the same form to fill the order and ship it. The Career product brings a wider range to the market, he said. "You can take forms you're using already and bring that form into play with very little modification," he said.

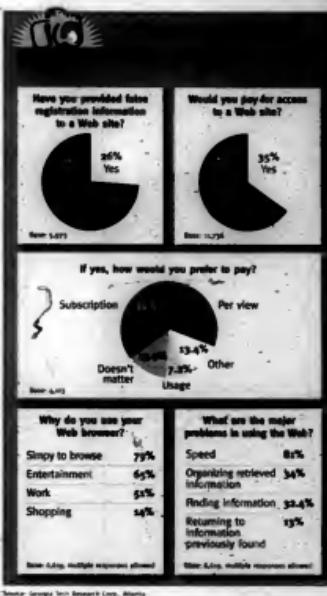

Chay Ryder, a senior industry analyst at Zona Research, Inc. in Redwood City, Calif., said Career's challenge will be to educate the market it is courting. "I just don't think we're at the point where we've established the market yet, but I do think there's a potential for it," he said.

Paper documents, however, may be the first to bite, he said. "If you were in an industry like health care or insurance or the government, this is a reasonably good substitute for a paper form," he said.

Scott McCready, a principal at International Data Corp. in Birmingham, Mass., said electronic forms can be valuable, but the forms alone may not solve an organization's problems. "This stuff is great for a really simple form," he said, but the back-end processes still must be in place. OmniForm Internet Publisher for Windows 95, NT and 3.1 will cost \$995; the data collector will cost \$299.

Career's OmniForm Internet Publisher lets users integrate paper forms with Web sites.

New Products

WebVision, Inc. has introduced Webtropolis OrderNet 2.0, an interactive order management system.

According to the Torrance, Calif. company, Webtropolis OrderNet 2.0 lets a business of any size create a virtual store at a new or existing World Wide Web site.

It then lets users adjust prices, display color images of inventory and accept payment.

Webtropolis OrderNet 2.0 features customizable templates, scripting tools for Hypertext Markup Language and an order management module. It also includes a database gateway that supports databases, including Oracle Corp.'s SQLServer and Sybase, Inc.'s and Microsoft Corp.'s SQL Server.

Pricing for Webtropolis OrderNet 2.0 starts at \$2,995.

Fast. Safe. Flexible.

No wonder we work well together.

Thoroughness and attention to detail are obsessions at BMW. So it's no surprise that they evaluated over 130 applications and all the major hardware providers when choosing information technology for their new manufacturing facility in South Carolina. The winners? Hewlett-Packard and SAP. Our team not only delivered a total, integrated client/server solution based on open systems — we got the system up and running in just four months, which is fully consistent with another BMW obsession: high performance.

For more information on how we can help put your company on the open road to success, call 1-800-275-7057 or cruise our homepage at <http://www.hp.com/go/hp&sap>

HEWLETT
PACKARD

IF YOU'RE RUNNING AN INTRANET WITHOUT LOTUS NOTES, YOU'RE BARELY SCRATCHING THE SURFACE.

Intranets are a great tool for sharing information. To get the most out of them, look to Lotus Notes. With Notes[®] you can now build intranet applications using the latest Internet technologies. And with the new interactive Web application server, code-named Domino, you can run them with standard Web browsers. Over 12,000 Lotus business partners can help you build and deploy applications that transform your intranet from a static publishing vehicle into an interactive environment for business collaboration. Notes[®] state-of-the-art replication gets the latest information to the people who need it. And with Notes[®] RSA Data Security, only those who need it.

For more information on how Lotus can help you manage the cost of your intranet, explore Lotus on the World Wide Web at www.lotus.com or call 1-800-828-7086, ext. C180, or contact your local Lotus sales representative. © 1995 Lotus Development Corporation. All rights reserved. Lotus, the Lotus logo, Notes, and Domino are registered trademarks of Lotus Development Corporation.

Notes natively supports Java, too. And Web standards too. HTML 3.2 and HTTP, SSL, SLIP/PPP, SNMP, and Telnet, POP3 and SMTP. And with ActiveX, Java and Netscape Plug-in API support, all the Web applications you're developing today will automatically work with Notes.

COMPARING INTRANET COSTS**

	Notes	Microsoft	Netscape
Server Price	\$495	\$5,773	\$3,680
Client Price	\$55	\$93	\$135

**For equivalent functionality as per Microsoft and Netscape Web sites 6/7/96. Visit www.lotus.com for more information.

More important, Notes does all this at a fraction of the cost of alternative products from Microsoft and Netscape. Take a closer look at a Notes-powered intranet. It'll open your eyes.

Corporate Strategies

By Michael Goldberg

A s tracked on the World Wide Web, one duck's small steps could be a boon to the efforts of a major Canadian wildlife conservation group.

Ducks Unlimited Canada has set up a mainframe-based Web site to promote its mission and offer a glimpse of what it means to be a mallard hen that is trying to nest and hatch ducklings on the Manitoba prairie.

Ducks Unlimited represents one of what should be a growing number of VM operating system users who set up their mainframes as Web servers, said Mike Kahn, CEO of The Clipper Group, Inc., a consultancy in Wellesley, Mass. "It's going to be a hot topic because it's scalable. And in many cases, if you're looking at a larger VM platform, it's relatively cost-effective," Kahn said.

Accompaniments
By using an IBM 3090 200E with VM, Ducks Unlimited made part of its machine a Web server, said Mike Conchette, manager of information systems at the group's headquarters in Oak Hammock Marsh, Manitoba.

The six-week project required TCP/IP-enabling software from IBM and a controller to connect its System/390 to the Internet via a frame-relay hookup.

Web feat

Ducks Unlimited modifies mainframe to go online

You thought Mom had it tough

Some observations
of Hen No. 5,
from
"The Mallard Tracker"

April 19: Hen radio-marked.

May 14: First nest,
incubating.

May 25: Nest destroyed
by predator (raccoon
suspected).

June 26: Second nest,
incubating.

June 26: Brood hen. She
hatched all 10 eggs!

July 2: Brood hen observed
with six ducklings.

Ducks Unlimited tracks mallard hens
and posts the results on the Web

Ducks Unlimited uses Enterprise Web from Beyond Software, Inc. in San Jose, Calif., to set up Web pages. Enterprise Web was designed to allow VM mainframe-based data to be viewed through standard Web browsers.

The main event at the group's Web site is "The Mallard Tracker" (www.ducks.ca/TWWR/tracker) an unfolding waterfowl drama started in May that tracks the weekly progress of 10 hens monitored via radio telemetry equip-

ment. Based on field biologists' logs, "The Mallard Tracker" shows how hens live, mate and die — in a four-state prairie section in southwestern Manitoba. Ducks Unlimited researchers there are studying how to save the mallards live with encroaching agricultural and commercial development.

For the non-profit group, which was established in Canada in 1937, the Web site provides a new tool for education and advocacy, Conchette said.

"Public education is a big thing for us. And with this Mallard Tracker, school kids can see and appreciate how difficult it is for ducks to survive and breed in the wild," he said.

Brian Kazmerik, a biologist and senior systems analyst at Ducks Unlimited, said the tracking experiment has found that ducks are drawn to some of the nesting habitats that researchers have installed.

Kahn said Beyond Software and Sterling Software, Inc. offer Web server products for VM users.

Both vendors' products will let users isolate a Web server from other functions on the mainframe, providing security that is inherent in the VM environment, he said.

Health care system garners raves

Complex CHCS
may help Pentagon
realize \$4.1 billion in
benefits

By Gary H. Anthes
WASHINGTON

Taxpayers appalled by systems development fiascos in government might be cheered by looking at the Pentagon's new health care system.

The U.S. General Accounting Office, best known for its cost-cutting critiques, recently called the U.S. Department of Defense's \$2.8 billion Complex Health Care System (CHCS), "a major achievement," especially "given the complexity of the system and the number of facilities involved."

Already deployed to all 505 medical facilities in the original plan, CHCS will produce some \$4.1 billion in benefits over its 16-year life, the audit agency said.

CHCS handles a wide variety of chores, from medical treatment tracking to pharmacy and laboratory order processing to

patient scheduling and hospital administration (see story, page 76).

In another unusual move, the GAO attributed much of the success to nontechnical individuals, especially U.S. Navy Capt. Paul A. Tibbitts, CHCS program manager since 1990.

He "applied a set of fundamental information management practices that leading private and public organizations use for success," the GAO said.

"We credit the strong leadership," said Patrick Taylor, a director at the GAO. "Capt. Tibbitts is very impressive; he's a doctor with a vast amount of information systems interests and abilities."

But Tibbitts, a cardiologist,

brushed off the praise, instead ticking off a half-dozen success factors, or "lessons learned."

He said representatives from every user constituency — doctors, pharmacists, nurses, radiologists and administrators — were assigned to the project full-time and were involved in virtually every design decision. "You can't make assumptions about user needs," Tibbitts said.

Closer inspection

Tibbitts said he welcomed the intense scrutiny focused on the program by the GAO, Congress, a high-level Pentagon technical review group and an independent panel of senior users.

"A lot of people would say,

"Gosh, dealing with all those bureaucrats and bureaucrats is very difficult." But if you listened to those people with all that experience, 'they're not all bad,'" he said.

In the end, Tibbitts said CHCS benefited by a life-cycle cost cap written into law each year by Congress. "That imposed a discipline on project managers that would have been hard to achieve otherwise," he said.

"Every time we made a decision about which new software module to put out or which new hospital we were going to deploy to, we had to return our forecasting models to see what that cost implications of that change would be," he said.

The scrutiny from others and the cost cap made it easier to rein in "requirements creep" by offering a credible reason for saying no to users, Tibbitts said.

But users apparently still called the shots to a considerable extent, said Tibbitts.

Capt. Paul A. Tibbitts:
The CHCS system
allows Congress
to rein in health care
requirements creep*

Just the prescription

The physician is the ultimate end user," said Capt. Jeffrey Warhaftig, a resident in internal medicine at Walter Reed Army Medical Center in Washington. He said he spends 15% of his day in CHCS terminal.

Warhaftig said he uses CHCS for near-real-time monitoring of patient laboratory test results, which used to arrive slowly on hand-delivered slips of paper. He also uses it to produce reports — some defined by him — that show trends in patients' vital signs, such as white blood cell counts in cancer patients.

Warhaftig said the electronic-mail capability in CHCS is "the central core of communications" at the hospital.

"When E-mail is down, the hospital is down," he said.

Warhaftig, a self-described computer enthusiast, said he is delighted with CHCS, but he acknowledged that some doctors are less than euphoric:

The GAO has in the past taken CHCS to task over physician complaints about data entry burdens.

But CHCS program manager Capt. Paul A. Tibbles is unrepentant. "Physicians' definition of the ideal computer system is 'nothing, first-out' — speech recognition," he said.

He said CHCS doctors readily use E-mail to type and edit their complaints about data entry, all the while using the very tools they are complaining about. — Gary H. Antke

Health care

CONTINUED FROM PAGE 75

able degree. For example, doctors participating in design reviews insisted that screens be set up in ways that corresponded to the practices they learned in medical school, Taylor said.

Tibbles said senior Pentagon management formed an independent program review panel under the surgeon general of the Navy, Army and Air Force.

And concerns for users is maintained in the operational system. For example, CHCS contains a real-time monitor that runs around the clock at every facility.

It sends an alert to IS management when actual response time exceeds standard, or expected, response time, Tibbles said.

CHCS features

Applications: Clinical, laboratory, patient administration, appointments, scheduling, pharmacy, radiology

Scope: 11 million patient records, 53,000 users, 5,262 sites worldwide, 23 million patients per year

Hardware: (3) Clusters of Digital Equipment Corp.'s Alpha servers running OpenVMS and Digital/VT or PC terminals; (2) clusters of Digital's VAX 8000 servers and networked PC servers running SCD Unix

Software: Applications written in Mumps with FileMan database management system; DOD and commercial packages

Briefs

The outsourcing side of Sears, Roebuck

Sears, Roebuck and Co. signed a five-year outsourcing deal with IBM's Integrated Systems Solutions Corp. (ISSC) under which ISSC will manage distributed desktop computing for Sears corporate and department stores in Hoffman Estates, Ill. ISSC also will provide help desk services at all Sears locations and back-office systems management for Sears stores. Terms of the agreement weren't dis-

closed. The deal follows an expired desktop support contract Sears had with Adavant. Adavant will continue to support Sears' data center operations, network and voice operations for the next six years, said Doug Zimmerman, a senior systems director at Sears. The desktop support deal with ISSC covers 6,000 machines.

Mass. tax returns are only a scan or phone call away

By April Jacobs

Tax season isn't everyone's favorite time of year, but the Massachusetts Department of Revenue is using a new imaging and workflow system to make the process a little faster for taxpayers.

The system has allowed the Department of Revenue to process tax returns more quickly and reduce the cost of processing returns by 26%.

Commissioner Mitchell Adams, whose department is responsible for collecting more than \$11 billion in state taxes each year, said the system makes work more efficient.

It has allowed data entry workers to process more than 600 documents per day, compared with 350 on the older system. The older system required manual key entry of information.

"We had a pilot [project] a year ago, and that was just cutting our teeth," Adams recalled. "But this tax season, January through May, we're really flying."

The department spent last year working out the bugs — including the tendency of its newly redesigned, imaging-friendly tax forms to jam scanners. During the 1996 tax season, the department handled 1.3 million returns, about 45% of which it receives by mail.

Scanning tax returns also lets the department capture 50% more data than it did previously because storage and retrieval of information is less of an issue. Files used to be stored at a two-acre facility in suburban Medford, Mass. — far from the department's headquarters in Chelsea, Mass.

Scanning tax returns also lets the department capture 50% more data than it did previously because storage and retrieval of information is less of an issue. Files used to be stored at a two-acre facility in suburban Medford, Mass. — far from the department's headquarters in Chelsea, Mass.

The Department of Revenue's Mitchell Adams: The move to electronic processing was a high-risk but painless effort.

File retrieval took up to two weeks. Now an optical jukebox holds that information.

The department in 1994 signed a deal with Unisys Corp. under which the state agency purchased \$3 million in scanning and data storage equipment over two years and received free systems integration services and software development services.

Unisys Corp. provided the data and image-capture software.

Worker efficiency

Alan Goloboski, deputy commissioner at the department, said it has retrained many workers to fit the new workflow system.

Instead of entering information about the return manually, employees scan returns with an Eastman Kodak Co. 9230 machine, which can scan the front and back of a page simultaneously.

The scanned information receives an identification number. It is checked for errors and for

warded to an accounting posting system. That system processes the returns for checks to be issued or bills to be sent.

Electronic processing also allows more time to be devoted to scrutinizing returns.

Goloboski said the department spends more time on audit leads and targets people who owe the most money. "The more quickly you can get to a person, the more likely they are to get your money," he said.

Adams said he refused to go ahead with the plan before getting firm guarantees from high-level executives at Unisys that the company was committed to making the system a success — a failure would have meant disaster for his office. "It was high stakes, and it worked," he said.

Nathaniel Palmer, a senior market analyst at Delphi Consulting Group, Inc. in Boston said deals such as the Unisys/Massachusetts Department of Revenue contract can benefit both sides.

"All this technology is quickly becoming a commodity, so what [Unisys] is selling is not an imaging system, per se, but expertise," Palmer said. The department gets the best available system, he said. "Unisys wants to be able to replace that system, so it's worth it to them to make sure it's right."

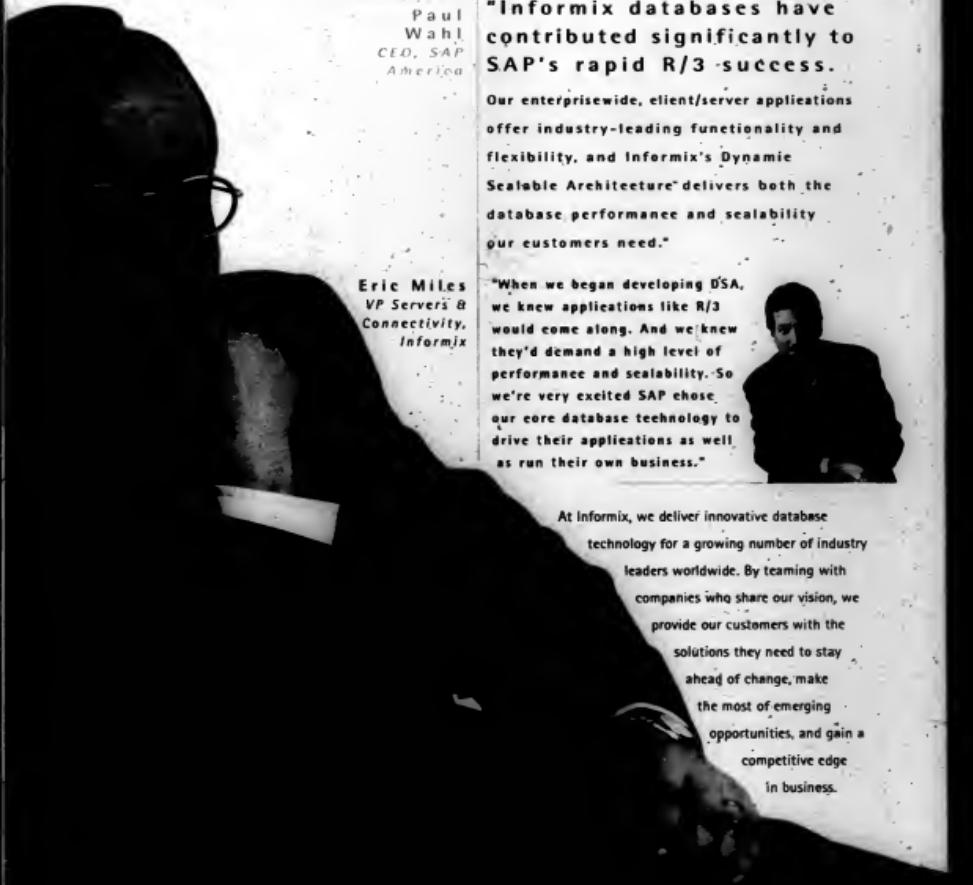

The department also let more than 400,000 taxpayers file via telephone this year. All would have filed the short form under the conventional system. They instead took several minutes to dial in their income figures and received refund checks within several days of filing, Goloboski said.

SIM working groups

The Society for Information Management (SIM) is forming several working groups to address topics of interest to member organizations and the information technology industry. The SIM working groups include:

Seeking members include: **Measuring the Business Value of IT:** Integrating IT and Business; **IS Project Architecture: Moving to Implementation; Transformation 2000; IT Challenges for Year 2000 Date Conversion; Collaborative Computing; and Groupware:** East Coast. Do you owe taxes on software? That depends

By Robert C. Sash and Sidney S. Silhan

If you are involved in software purchasing, you can't afford to be unfamiliar with sales tax issues. Some companies have overpaid for their software because they were ignorant of sales tax laws.

Although each state has its idiosyncrasies in how it determines what is taxable and what isn't, there are a few things to bear in mind that will help determine if you are being charged the appropriate amount of tax.

• **Types of software:** From a tax perspective, there are two broad categories of software: Canned software is prewritten, can be bought off-the-shelf and generally is taxable. Custom software — which doesn't include any prewritten or preproduced modules — is exempt from sales or use taxes in many states but not all. Some states are unclear about what constitutes custom software and how much canned software must be changed to be classified as custom.

• **Modifications:** Some states tax any modification to software; others don't tax significant modifications. Many states that don't tax modifications, however, often require that the charges for modifications be stated separately from other charges that appear on the bill.

• **Installation and training services:** Many states don't subject software installation services to sales or use taxes. Other states base the taxation of installation services on the functionality of the underlying software. Still others tax installation services of any kind of software. Generally, states don't tax training provided by software vendors to clients, although the training must be separately stated from other charges.

• **Maintenance contracts:** Some states tax all maintenance contracts, regardless of whether they include transfers of tangible personal property or involve only the sale of services. Other states don't tax maintenance contracts if the service portion is separately stated or billed.

• **Sale vs. lease:** Many states don't tax software leases, although they may tax the sale of such software. There are rules that must be followed to classify a lease for taxation purposes.

• **Potential exemptions:** Some states offer sales and use tax exemptions on certain

types of products. For example, software used in manufacturing tangible personal property is often exempt.

• **Transmitting software to customers:** Some states tax software regardless of how the software is transmitted to the purchaser. Other states will tax only soft-

ware that is delivered to the customer on a disk or other tangible medium and will exempt software that is transmitted electronically. But this exception could be lost if any tangible property is delivered. To avoid this, software developers should charge separately for anything

that isn't sent electronically.

Perhaps the best advice for those who purchase software is to work with vendors to determine the least expensive way to handle the transaction — and, most important, be savvy about your state's tax laws.

MasterCard tests a smart way to trash cash

By Betty B. Daguio
MANILA

The world's first reloadable stored-value smart card is being beta-tested by MasterCard International, Inc. in different parts of the world.

The MasterCard Cash smart card is a chip-based application that is programmed to store a value of up to \$100. It was designed as a fast, convenient alternative to coins and bills for making purchases, typically less than \$20.

The stored cash amount is reduced ev-

ery time consumers spend their electronic cash. No personal identification numbers or transaction codes are necessary, and the value of the purchase is transferred from the customer's smart card to the merchant.

The smart card, developed in Canberra, Australia, has a Unix-based backend sys-

tem that runs an Oracle Corp. database to do transaction processing, clearing and settlement, fraud reporting, lost or stolen card recovery and customer service.

Jerry McElhatton, president of global technology and operations for MasterCard, said third-party providers have provided the infrastructure for MasterCard globally.

The main hardware platform used is from AT&T Corp., but this will be upgraded to a Sun Microsystems, Inc. flight-head server to run the required large, central Oracle database.

McElhatton said pilot programs are being done in New York, involving 50,000 customers and 500 area merchants. Other pilots are also taking place in Latin America and South Africa, using a multitude of vendors and systems to make sure the card is interoperable.

The nine-month Canberra trial, meanwhile, involves three financial firms that collectively will issue 10,000 smart cards.

MasterCard officials said hybrids with both magnetic stripe and chip technology will be common in the transition to smart cards. This is to ensure acceptance of the new technology as banks move to introduce smart-card readers globally.

"I think it would be a long time before the magnetic stripe card would be obsolete, but the chip card is much more powerful and has the potential for growth," McElhatton said. Within two to five years, the market will see a lot of smart cards with reloadable computer chips, he said.

MasterCard also is involved in securing card transactions, and marketing through the World Wide Web. It endorses a industry specification to secure electronic commerce on the Internet, called the Secure Electronic Transactions.

MasterCard also plans to tap the Internet to corner the \$1.5 trillion market for electronic payments.

Daguio writes for *Computerworld Philippines*.

Briefs

Low rates from IBM

IBM Credit Corp. has implemented reduced financing rates for IBM and non-IBM software and services. Customers with top credit ratings now qualify for rates as low as prime on leasing deals of 36 months or less. And up to \$250,000 worth of software and services can be financed without any hardware being involved.

Building warehouses

Sears, Roebuck and Co. has selected IBM's RS/6000 SP server and Informix Software, Inc.'s OnLine Ex/extended Parallel Server database system to help the retailer build several large data warehouses, beginning with its credit and home services businesses.

Break out the champagne, it's a crisis!

*Don't let long nights
and working weekends
ruin your team. Treat
those stress-filled times
as opportunities for
bonding.*

By Natalie Engler

What do Little Red Riding Hood, a hot air balloon and a high school gym have in common?

Stumped? So was Robin Hodder's team of technologists when she asked them that question at 3 a.m. on a Saturday. They were alone in Bank of Boston's trading room in the midst of a weekend-long systems test. Phones were ringing, programs were running and the air was filled with the smell of stale pizza.

Sensing that they needed a pick-me-up, the senior manager broke out Tribond, a game that lists groups of three seemingly unrelated items and asks what links them. Finally she answered: "They all have baskets." Then she moved on to questions about popular culture—and tracked how many times they answered "Farrah Fawcett." Not only did the silliness keep them awake, but also "I gained a lot of insight into the way my staff thinks," she says with a chuckle. "Now I know all their innermost secrets."

Savvy managers such as Hodder are discovering that a project's almost inevitable "Weekend from Hell" doesn't have to burn the team. When they plan for those fires, more often than not they fuse into a cohesive unit.

Continued on page 82

CONTINUED FROM PAGE 81

Here's how
it works...

Goal:
Choose the right people

Tool:
An index to identify
individual strengths

Don't put just anyone in your foxhole. A team made up of people who complement and reinforce one another's skills is more likely to endure when crunch time arrives.

Kathy Kolbe, CEO of Kolbe Corp., a consulting firm in Phoenix that specializes in organizational development and performance forecasting, says the secret to building a high-performance team is to focus on "the natural way people do things." In this spirit, she spent the past 20 years creating tools to identify people's instinctive strengths, much like the well-known Myers-Briggs personality profiling method. She calls these strengths "action modes" and labels people with those tendencies Fact Finders, Follow Thru, Quick Starts and Implementers.

Fact Finders tend to be thorough, precise and detail-oriented, she says. If you withhold from them even seemingly irrelevant specifics, the resulting stress will hurt their performance. Follow Thru are good at classifying, organizing and integrating information — as long as they have a context. Give them a flowchart, plan or matrix, and they'll see the difference. Quick Starts can promote and sell a project. But they may overestimate the stress for the team. Implementers work best with the mechanics of the environment. They are methodical, hands-on and often overlooked — and prone to ignore them that may wind up with someone that doesn't run on the machine.

In designing a team, make sure you cover all the categories, Kolbe says. People perform best when they are in their proper roles and understand one another's ways of working.

Goal:
Create camaraderie

Tools:
Racquetball, the beach, Jazzercize

Once you have the best mix of people, the next step is to build camaraderie.

"One of the best project managers I've seen started bonding people at the beginning of the project," says John Silivis, founder and CEO of management consultancy Silver Associates, Inc. in New York and author of *Corporation vs. Tightrope*.

"He begins every project by assigning a project leader as manager and sending the team to a two-day off-site meeting," Silivis says. There they learn about how a project's politics and dynamics can change, what problems to look for and how to deal with personality clashes. They also engage in intense physical activities, such as racquetball, followed by dinner and drinks until dawn. The next morning — they wake up early and jog together before an 8 a.m. breakfast and repeat the drill. "By the end of the weekend, the team will walk over hot coals for [the project manager]," Silivis says.

Hodder's team remains tight thanks to beach outings and dinner at her house. One time the team members even went to a Jazzercize class together. "All of that energy," she says. So do biweekly status meetings during which everyone speaks. "We go around the table, and if someone is stuck or behind, others offer to help. Initially you encourage this. Then it starts to happen naturally."

Minimizing stress helps avoid despair. But to really boost performance, there's no stimulant like laughter.

Bob Dorsey, SAP project manager at Eastern Chemical Co. in Kingsport, Tenn., credits humor — and Kathy Kolbe's method of indexing team members' strengths — with helping his team complete a major companywide SAP implementation in just 20 months with no turnover.

When times got tough, Mark Calahan, a country music-singing team member, would write a song about it, such as "We Are the Crashed," sung to the tune of "Those Were the Days."

The night before Hodder's team faced a particularly depressing status meeting, she grabbed a piece of poster board and wrote down each member's pet expression. The next day, after they finished lamenting the state of the project, she pulled out the board and revealed the phrase: one by one.

"Dumb. Boom.... Who says that?" she asked. They grinned and pointed at a sheepish colleague. Next: "How does this affect me?" Then: "Zoinks!"

"What a difference it made in their attitudes," she recalls. "It pulled them out of the pits of depression when they needed it." And it got them back into the project's groove. ■

Engler is a freelance writer in Cambridge, Mass.

Here's what he advised: Isolate the senior managers for several hours so they can avoid "stare" questions such as "Who did it?" and "When will the problem be fixed?" Next, designate one "press" person to provide periodic updates. Eliminate the words "should have" and "built" from everyone's vocabulary for the recovery's duration. And reduce the stress placed on the recovery team's technologists so they'll make fewer mistakes.

To reduce stress on the team members, the company brought in massage therapists. A human resources person delivered food and champagne. ("People need champagne more when they are under stress than when they are celebrating," Kapur says with a smile.) And the company hired a taxi to ease exhausted team members' commutes. The process was so successful, the company is making it part of its long-range disaster recovery plan, Kapur says.

Goal:

Energize with laughter

Tools:

Poster board, sayings, country music

Minimizing stress helps avoid despair. But to really boost performance, there's no stimulant like laughter.

Bob Dorsey, SAP project manager at Eastern Chemical Co. in Kingsport, Tenn., credits humor — and Kathy Kolbe's method of indexing team members' strengths — with helping his team complete a major companywide SAP implementation in just 20 months with no turnover.

Fear of information

Russians may use computers, but they're a long way from entering the Information Age.

Ella V. Chepally, a professor at Fairfield University in Fairfield, Conn., spent three years studying information systems practices in Russia.

Or trying to.

She was evicted from her apartment in Kemerovo, a large Siberian city, for interviewing Georgians. Many Russians — including her former landlord — stereotype Georgians as criminals. She couldn't distribute questionnaires, tape-record interviews, ask blunt questions or take notes in front of the people

she interviewed; all these things aroused fear and suspicion. "For Russian managers, it seems almost unprofessional to talk openly," she says. Most interviews were conducted while walking outdoors.

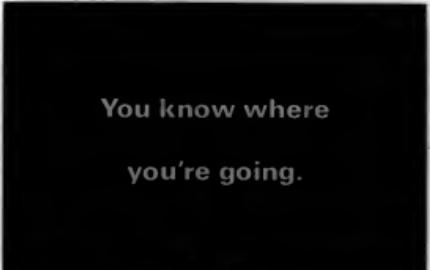

But the plucky professor managed to finish her study. Not surprisingly, she found that a lack of high-quality data seriously hampers the development of IS in post-Soviet Russia. Irregular accounting practices, lack of statistics, managers who won't share information and fear of disclosing information are just a few of the barriers to IS and IT professors.

Fear of information is hampering Russia's service industries. They want to use IS for

operations but have a hard time getting information. For example, Chepally says, IS managers at Goravit, a telephone insurance company with offices in Kemerovo, can't obtain actuarial data and have difficulty collecting information from their clients.

Chepally's findings are one of many reports in *Global Information Technology and Systems Management: Key Issues and Trends*, a collection of studies on 15 practices around the world edited by Preeshat C. Palvia, Shekhar C. Palvia and Edward M. Roche (Ivy League Publishing Ltd., New York, N.Y.; 1996; 635 pages; (609) 891-0446). — Allen E. After

Managing

IS — by the numbers

Deloitte & Touche Consulting Group has come out with its annual survey of chief information officers. Here are some nuggets that widened our eyes. The consultancy in Wilton, Conn., surveyed 431 CIOs late last year and early this year. To obtain a copy, contact Jan Finnegan (in Kansas City, Mo.) at (816) 882-5118 or by electronic mail at jfinnegan@dttus.com.

Spending is on the rise ...

IS spending is increasing faster than the inflation rate
(Average IS budget increase) (Consumer price index)

	1995	6.3%	4.5%
	1994	3.5%	2.7%
	1993	0.4%	2.7%

... as is spending on IS training
(Training spending as percentage of IS budget)

	1995	4.3%
	1994	3.0%

Hard to find

Think SAP experts are tough to find? Here are four positions that CIOs feel are even harder to fill.

(Percentage of CIOs listing position as difficult to fill)

Client/server technical architect	77%
Database expert, distributed	68%
Data modeling expert	64%
GUI designer	63%
SAP application expert	57%

See you later?

Annual CIO turnover rate:

17%

Call in the network guy

80% of CIOs say communications and networking is the most important technology for re-engineering. But Chuck Numamaker, a principal at Deloitte & Touche, says networking experts are rarely part of re-engineering teams.

Internet barriers

The usual barriers to new technologies — lack of tools, personnel and costs — aren't holding back the Internet right now. It's security concerns and the what-do-we-do-with-it factor. "Businesses haven't figured out how to use the Internet, so it's taking a backseat to other applications when the use of the technology is clearer," Numamaker says.

(Percentage of respondents reporting the barrier as significant)

Security limitations	81
Other projects having higher priority	68
Lack of proven business benefits	63
Immature technologies	51
Uncertainty about future Internet direction	38
Lack of qualified developers	39
Lack of development tools	23
Complexity	17
Cost	16

Lights! Camera! Dilbert?

You loved the comic strip. You bought the book. Are you ready for Dilbert, the Movie? We are. And though we don't know whether cartoonist Scott Adams is bound for Hollywood — Computerworld doesn't have a few actors — we aren't afraid of suggesting a few actors who would be perfect. Here are our picks; submit your selections to our Web site, www.computerworld.com, and surf the site this week for the "casting call."

Dilbert — Anthony Edwards (star of *ER* and *Revenge of the Nerds*)

Dogbert — Danny DeVito

Rubert — Tom Hanks

Calbert — Joe Pesci

The Boss — Ned Beatty

Alice (female engineer with triangular hair) — Bette Midler

Wally (short, bald engineer) — James Alexander

Young, naive engineer — Matt LeBlanc (*Friends*)

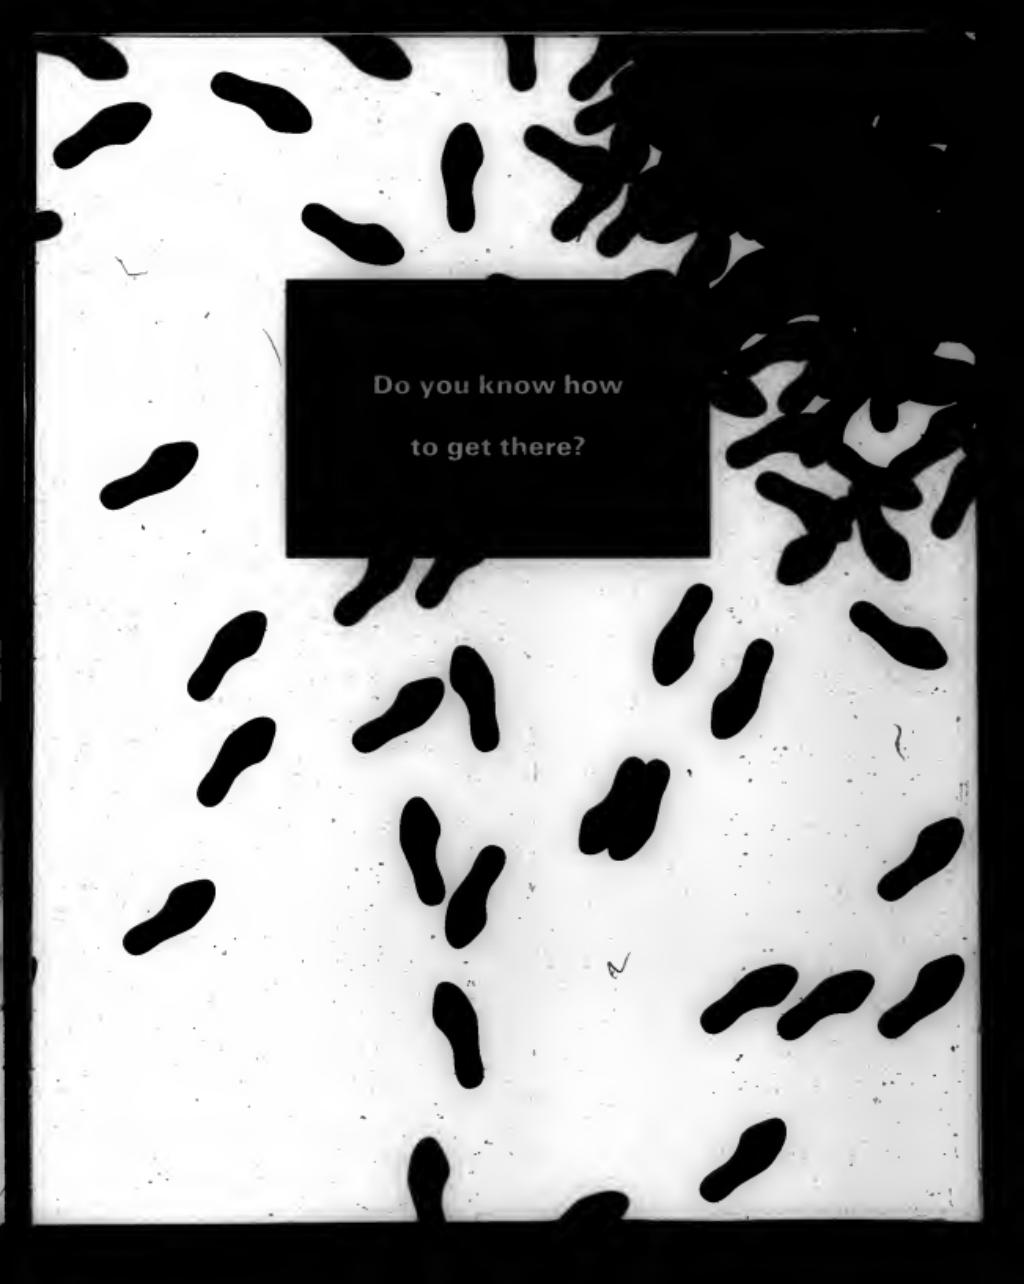

Phil, the Prince of Insufficient Light — Jerry Seinfeld

DeVito

Edwards

OCTOBER - DECEMBER 1996

HOT HAPPIENINGS

Our picks for the IS events you gotta get to

Gartner Symposium/ITxpo '96

Walt Disney World Dolphin and Swan hotels
Disney's Yacht and Beach Club Resort
Lake Buena Vista, Fla.
Oct. 7-11

Are you looking for a 50,000-ft.-high view of information technology developments and trends? Don't mind enduring sweltering humidity to get it? Then head for central Florida. Each year, thousands of information technology professionals flock to Gartner Group, Inc.'s weeklong symposium. Gartner dishes up a comprehensive look at the state of information systems; it's hard to think of a technology, trend or management issue that's left unturned. One-on-one time is also available with Gartner analysts. But be forewarned — the place is crawling with Gartner sales representatives. This year's theme: "Managing Diversity in the 21st Century." You may not go home tanned, but you will be well-informed.

Cost: \$5,715 (Gartner clients); \$2,195 (nonclients)

Contact: Gartner Group, Stamford, Conn.
(800) 778-1997 or (203) 316-6757
E-mail: spears@gartner.com
Web address: www.gartner.com

National IS Security Conference

Baltimore Convention Center
Oct. 22-25

Like it or not, the feds strongly influence information security standards and technology, which makes this annual gathering of government security gurus a must for computer security professionals. The event is cosponsored by the National Institute of Standards and Technology (NIST) and the National Security Agency's (NSA) National Computer Security Center. There will be sessions on the latest security technology and issues, including firewalls, intrusion detection, cryptography, Internet security, electronic commerce and legal issues. This may be the only opportunity you'll ever get to talk to people who will admit they work for the NSA and, even more astounding, will tell you what they do.

Cost: \$295; \$335 after Sept. 20.

Contact: Tammy Grice, NIST, Gaithersburg, Md.
(301) 975-5863
E-mail: NISSCconference@dockmaster.nscse.nist.gov
Web address: csrc.nist.gov/niisc/

Computerworld staff members **Allan E. Alter, Gary Antes, Rick Saia, Craig Stedman and David B. Wilson** contributed to this report.

Comdex/Fall '95 drew nearly 207,000 attendees

Comdex/Fall '96

Las Vegas Convention Center
Nov. 18-22

A sure bet for anyone interested in PCs. With about 2,200 exhibitors on tap, Comdex organizers expect this year's attendance to exceed last year's turnout of close to 207,000, so you may want to make your plans now. The show is in its 18th year as the world's

largest and most prominent information technology event for resellers and corporate decisionmakers. The conference and exhibition highlight the latest advances in computer systems, including software applications, personal digital assistants and multimedia systems. But rooms and taxis are hard to find, and the sheer size of Comdex could exhaust a triathlete. And if networked applications are your

thing, you'll probably do better at NetworkWorld/Interop Atlanta, which will be Sept. 16-20.

Cost: To be announced

Contact: Softbank/Comdex, Needham, Mass. (617) 433-1665
E-mail: ambrose@comdex.com
Web address: www.comdex.com

Fall Internet World '96

Jacob K. Javits Convention Center, New York
Dec. 9-13

Internet World is the 'net show to attend this fall if you have time for just one. It's emerged as the PC Expo of Internet events. Mecklermedia Corp. officials say there will be 140+ sessions and 550 exhibitors interhawking all sorts of Internet products and services. IBM Chairman Louis V. Gerstner will be one of six keynote speakers. Whatever is making the rounds in 'net circles — from hot new products and services to vendor big shots explaining their Internet strategies — is sure to stop at the Big Apple's Cavern on the Hudson.

Cost: To be announced

Contact: Mecklermedia, Westport, Conn.
(800) 632-5537
E-mail: fall@mecklermedia.com
Web address: events.world.com

Winter Project World

Santa Clara Convention Center and Westin Hotel
Santa Clara, Calif.
Dec. 9-13

If Dustin Hoffman were to revive his role in *The Graduate* for the '90s, perhaps the hot-top career advice he'd get is "projects." For those who want to improve their project management skills, it's hard to beat Project World. The focus is on IS development. The presenters are seasoned project managers. The tracks and sessions cover practically any problem that might be eating your liver, and the attendees are people who sweat the details and the deadlines, just like you. You should emerge from this conference a shrewder project manager. If you can't wait until December, Summer Project World East is Aug. 5-9 at the Omni Shoreham Hotel in Washington. Organizers claim there will be little overlap between the two events.

Cost: \$395-\$1,595

Contact: Center for Management Research, Wellesley, Mass. (888) 943-4444 or (617) 431-9797

FREE for a Limited Time... A CD ROM Preview of

The Top New Data Warehousing Software

When 200,000 IS managers were asked to choose the top software for data warehousing, their answer had a familiar ring:

SAS software from SAS Institute.

As the only end-to-end solution for rapid data warehousing, SAS software delivers everything you need to manage, organize, and exploit your business data. The tools you use to build a data warehouse are the same ones used to maintain it...run it...and change it. And what's more, everything's scalable. You can jump right into enterprise-wide information delivery applications...or start small and build on your success.

SAS software doesn't consume overhead for database features you don't need. And once you have data in the warehouse, you'll find everything you need for data query and reporting, OLAP/multi-dimensional analysis, data mining, database marketing, data visualization, and much more. It's never been easier to access your data...or to arrive at informed decisions by turning raw data into real information.

Software for Successful Decision Making

BIG BLUE

BY JOSEPH MAGLITTA

BY JOSEPH MAGLITTA

What do you do when you're the world's biggest computer company and you've got the rug attention of 3.5 billion viewers? Sell computers, of course. Or at least, strut your technological stuff.

That's just what IBM will be doing when the 1996 Summer Olympic Games open in Atlanta this week.

For 17 days, Big Blue will use its role as sole information systems sponsor of the Olympics to capture its last glory as the computer supplier to the world. In the past 15 months, IBM has constructed a gargantuan worldwide information system that includes more than 100 applications. The system is meant to showcase manageability, security,

availability and scalability.

"IBM's message is clear: IBM can provide one-stop shopping for all the information technology needs of an entire enterprise — systems, network solutions, software and service," says Joe Clabby, director of transitional technologies at Aberdeen Group, Inc. in Boston.

Sound like a throwback to the old captive-customer days? Not everyone agrees, says Clabby, author of a recent report on Big Blue's Olympic technology. Large customers and many European firms find "a certain, safety" in dealing with IBM, especially in the strange new territory of cyberspace, he says.

Among the new products to be demonstrated: Net Commerce Internet commerce server software and Web Objects Manager, technology. New roles for AS/400s as distribu-

tion servers will also be highlighted.

Will IS leaders be wowed? It depends.

Stuart Greenfield, who helps oversee a showcase IBM ES/9000 site at the Texas Comptroller of Public Accounts, says the IBM tour de force sounds impressive. But he says the state will look for best-of-breed solutions on the Internet and elsewhere.

Heeding commands reportedly handed down from Chairman Louis V. Gerstner, the Olympic effort involved nearly every corner of IBM: 38 business units on six continents. In terms of personnel and development time, the effort cost IBM far more than its \$40 million sponsorship fee.

IBM's public relations machine has been barnstorming the country. A specially equipped Winnebago displays a half-dozen of the most im-

pressive systems, including the first official Olympic home page and a Notes-based master security system.

IBM has taken great pains to avoid the worst-case scenario — a globally televised crash and melt-down, says Jose-Luis Iribarren, manager of Olympic and Sports Interest Systems at IBM. He says IBM has made the system bulletproof by building in extensive redundancy and backups. The company has also created an architecture "that widely distributes processing power."

Clabby says IBM has a good chance to pull off the Olympic fest. "If IBM scores a perfect 10, it will have sent a message to the world that IBM is still the premier supplier of complex systems," he says. ■

Maglitta is Computerworld's senior editor, corporate strategies.

WEB BROWSER

WHAT WEB USERS CAN DO

Get direct, continuous access to core Olympic systems and databases. Build customized pages on the fly from dynamically changing data.

Surfers also can get news on the Games automatically posted to their Web servers; video from NBC's Atlanta affiliate, 400 images, including photo flashes, from 40 closed-circuit TV cameras via the "Sports" "net camera"; Sports Illustrated online; one-click travel information venues; 3-D tours of the stadium. Web visitors can also sign the visitor guest book and follow the adventures of top, the automated Olympic mascot.

NEWS IT WORKS! Users' customized pages link to objects: IBM data is distributed by Java applets that dig into databases. Content is all systems are modular objects, not files.

FACTS

NETWORK

"Virtual wide-area network" links 250 Token Ring LANs at 31 venues with frame relay and AT&T and BellSouth public networks. Configurations can be changed on the fly. Equipment: IBM 3745 network controllers and T1 network links split into three sublinks running frame relay; IBM 2200 controllers for T3; 2,000 miles of fiber cable.

LEGACY INTEGRATION

Advanced peer-to-peer networking and communication bridges older Olympic systems, including 3270-based legacy applications, and new client/server architecture.

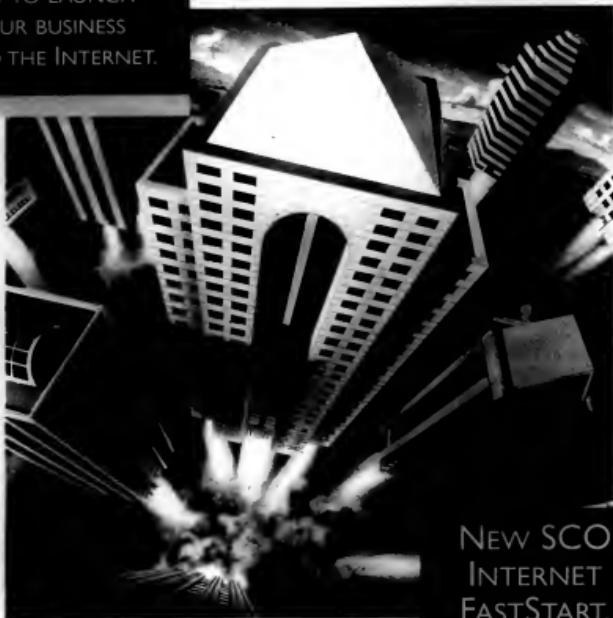

BULLETPROOFING

Embedded Web Object Management Complex load-balancing software from IBM Research optimizes world traffic, automatically finds most open servers regardless of location. Each venue has a copy of Results systems and can run by itself if network connection fails. There are 52 new backup T1 lines and 130 massively parallel processing nodes. Two remote System/360 servers mirror centralized data repository.

PRODUCTS SHOWN THAT WILL PROBABLY BE COMMERCIALIZED

Net.Commerce server software, Merchandise server, personal home pages, Web Object Manager, commercial weather forecasting systems for aviation and agriculture, various audio and video products

THE MOST AFFORDABLE
WAY TO LAUNCH
YOUR BUSINESS
ONTO THE INTERNET.

NEW SCO
INTERNET
FASTSTART.
\$995.

THE WORLD'S MOST
AFFORDABLE BUSINESS
CRITICAL INTERNET SERVER.

Without SCO® Internet FastStart, deploying internet access across your enterprise is extremely expensive. FastStart gives you the power and reliability of a UNIX® system at a very low cost. And because it can be deployed on inexpensive Intel® processor-based servers, your hardware costs are lower, too.

FastStart lets you access, publish and conduct business on the Internet. And to share internal information via intranets. But it doesn't take a rocket scientist to install and maintain.

SCO Internet FastStart Includes:

- SCO OpenServer® Enterprise
- Netscape Communications Server®
- Netscape Navigator® 2.0
- Multi-line PPP and Multi-homing support
- Graphic Installation and Configuration Tool

Don't risk grounding your business with a more expensive, less reliable server solution. Call SCO today.

ATTEND

Computerworld's Washington D.C. Area Corporate Technical Recruiting Conference!

Monday, September 16, 1996
Fairview Park Marriott, Falls Church, Virginia

On September 16, 1996, you have a special opportunity to update your recruiting skills and network with recruiters in your area at the first-ever Washington, D.C. area Corporate Technical Recruiting Conference, held at the Fairview Park Marriott, Falls Church, Virginia.

A Full Schedule of Contemporary Topics

7:30 a.m.	Continental Breakfast & Conference Registration
	Concurrent Sessions
	Proactive Recruitment Techniques
12:15 p.m.	Luncheon Keynote
	Repeat of Concurrent Sessions
	Town Hall Forum
6:00 p.m.	Program ends

Conference Registration Fee*

On or Before - August 1, 1996	\$255.00
August 1 - September 1, 1996	\$295.00
After September 1, 1996	\$325.00

* Registration fee includes continental breakfast, lunch and the complete Conference Resource Guide.

Proactive Recruitment Techniques

Deve Drugmen, President, Bay Cities Research, Inc.
To remain competitive, today's technical recruiters need to be aware of the latest trends in sourcing and proactive recruiting. This in-depth session from a leading expert will explore this critical topic and will help you put your resources and expectations into proper perspective.

Industry Trends

Lunch/Keynote Address

Marylyn Johnson, Executive Editor, Computerworld
Sure, there are new skills entering the market every day, but what are the trends that drive these skills? Marylyn Johnson, one of the country's leading watchers of the Information Systems profession will give you an up-to-the-minute view in this very special keynote address.

Town Hall Forum

Gary Cluff, President, Cluff and Associates

In this session, you'll not only be able to propose your specific questions for open discussion, you'll learn how real world issues and solutions from your peers. You won't want to miss this rare opportunity as Gary Cluff, an expert in the HR field, leads us through this modern discussion of your recruiting topics.

Corporate universities:

What you are seeing is the corporate world attempting to build a world-class workforce — Joanne C. Meister

Indeed, when you talk to business managers about their biggest challenges, in many cases, you'll hear them say that current academic curricula simply aren't meeting their needs. IS, in particular, pays an enormous amount of money to contractors for the types of skills they would like to develop in their own people.

So class offerings cover a wide range. Some focus on "core competencies," such as developing leadership skills or understanding corporate values. Others emphasize "horizontal" learning, where marketing employees can learn about technology, for example, and vice versa. And highly specialized "vertical" classes teach specific skills such as C++, systems integration, object-oriented programming or project management.

But the job of retraining and reskilling a workforce shouldn't be done in a vacuum. You need the resources of an outside learning partner. It's very important for corporations to seek partnerships with academic institutions. The biggest reason: Corporate universities are most successful if the "credentials" they provide to students are portable. That is, if completing a class or series of classes results in a certificate or degree that has meaning outside the corporation. When a corporate university is affiliated with an accredited academic institution, the courses make employees more valuable — not just within the organization, but in the job market at large.

IS employees are concerned about building their own portfolio of skills — especially in this era of downsizing. This provides big motivation for employees to get the kind of training that will, in turn, make them better employees. And the corporate university "credentials" — awarded for classes or programs created in partnership with an academic institution — are indeed turning out to be quite valuable out-

side the corporation itself. We also see trade and industry associations recognizing these types of credentials.

But many corporate universities that want to develop these partnerships are frustrated with the reception they get from academia. Academics have their own, sometimes rigid, way of doing things. They don't always like the idea of partnering with business, even though they have much to gain.

For starters, there's the opportunity they have to increase the number of enrolled students. To create new kinds of degrees. To raise funds from local businesses for research. Such a partnership gets academic faculty into the real world, gets them involved with leading corporations in the area and lets them exchange "best practice" stories and work on research projects of mutual interest.

One of the downfalls from a university's point of view is that tenured professors might not be particularly interested in building these kinds of relationships. It could be a significant challenge getting faculty excited. Academics also tend to worry about working too closely with business — how objective will a university be in its research efforts if these alliances are too close?

The corporation is also taking a risk with such a partnership: the risk that it won't get a curriculum tailored exactly to its specific needs.

So, in fact, we are seeing a lot of resistance between the two communities. Therefore, there's a need to understand how to work together. Precisely because universities and corporations speak two different languages, there's inevitably a period of awkwardness, of trying to understand each other, that can cause a steep learning curve in a collaboration. But it's worth it. ■

PRO: A skilled workforce

Joanne C. Meister is president of Quality Dynamics, Inc., a New York-based consulting firm that specializes in corporate university management. She is author of *Corporate Quality Universities: Lessons in Building a World-Class Work Force* (Iswi in Professional Publishing, 1994). She is also chairwoman of an upcoming symposium, "Corporate Universities Enter the 21st Century," to be held Sept. 8-10 at Motorola University in Schaumburg, Ill.

In 1990, when I was researching my book, there were approximately 400 businesses in the U.S. that had created internal organizations that fell into the category of "corporate university." Today, that number has grown to more than 1,000. And there are a lot of corporate dollars being invested in these organizations. The average budget is close to \$10 million. During the past year, I've seen a significant amount of interest in the corporate university concept from information systems departments in particular.

Why all this activity? For starters, the

basic goal of a corporate university is to design training and education that aligns employees with the skill sets required for success within an organization. So what you are seeing is the corporate world attempting to build a world-class workforce linked to the particular strategies, culture and mission of the organization.

Most important, these businesses feel that designing their own educational curriculum is the best way to accomplish this. They feel there's a gap between what is taught in academic institutions and what corporations require from IS employees.

Many corporations are playing a lead role in determining IS college curriculum. The immediate result can be better employees. But what about the long-term career impact?

By Alice LaPlante

opposing schools of thought

CON: Too focused on today

William King is a university professor at the Katz Graduate School of Business at the University of Pittsburgh. He is founding president of the Association for Information Systems, a 1,400-member professional coalition of information systems academics, founded last year.

I see several reasons for the proliferation of corporate universities: convenience, cost savings, dissatisfaction with university information technology curricula, a desire to exert greater control over what is taught and a belief that academics don't understand the "real world," among others.

Some of these reasons are well founded. But I also believe that at least part of the current interest in forming internal universities is a result of the general tendency of individuals and organizations to indulge in curve-building, when perhaps they should just stick to their knitting.

I don't believe that an alliance with an academic institution is critical. Most academics — including me — can be hired to accomplish specific educational or training goals on an as-needed basis. There are other ways to engage the talents of academic personnel without a formal alliance.

The major risk for the company is that control of content will be lost, and they won't get what they want. The major risk for the university is that they will "sell out" to gain much-needed revenue and get themselves associated with poor-quality programs. And each of these things can happen incrementally despite the best intentions of both sides.

Another risk — and this is an important argument — is close collaboration. There's

a necessary tension that should exist between IS practitioners and academics — a tension that is good for the IS world. For example, corporate people usually want training and education to focus on things that are directly relevant and immediately applicable. Academic programs aren't necessarily good at doing that, and they shouldn't have that as their primary goal.

The goal of an education is to make people better thinkers, problem-solvers and decision-makers. It is to train students in the latest management fad or the latest technology. Universities must focus on the long-term career needs of their IS students. And good academic programs are rigorous as well as relevant. In addition to teaching students how to think effectively, they emphasize theories, rigorous methods and the assumptions that underlie various management tools and techniques.

For example, a company embarking on creating a client/server architecture might understandably wish to offer a course on that topic. A university class on client/server would probably begin by focusing on a variety of architectures, how they compare, what the costs and benefits of each are under various contingencies and how the decision involving selection of an architecture should be formulated. It would provide hands-on experience only to the degree that it is needed to truly understand

the broader issues. The company, having made the decision to go client/server, would probably see much of this as too theoretical or insufficiently applicable.

I don't want to seem unconcerned with the practical side of technology. But what usually differentiates corporate universities from academic programs is that academia is more focused on the long term and more concerned with broader issues than day-to-day kinds of things.

Corporations should form their own universities only when it is clearly superior to other alternatives — some of which may require some innovation to develop. Otherwise, the next CEO will come in and cut out what may be perceived as unnecessary fat, and both the company and its related universities will have lost. ■

LaPlante is a freelance writer in Woodside, Calif.

The goal of an education isn't to train students in the latest management fad or the latest technology

— William King

UNITED NATIONS HIGH COMMISSIONER FOR REFUGEES GENEVA, SWITZERLAND

The United Nations High Commissioner for Refugees (UNHCR), with headquarters in Geneva, Switzerland, and offices throughout the world, seeks an experienced SENIOR INFORMATION SYSTEMS OFFICER (PROJECT LEADER) for its Information and Computer Systems Section in the Division of the Controller and Management Services, based in Geneva.

UNHCR plans to implement a new large-scale computer system using current advanced technology. This post requires extensive experience in all aspects of project management (planning, budgeting, monitoring) and a proven track record in the successful implementation of at least one large-scale integrated computer system using client/server architecture and large-scale relational database (preferably on a Unix platform using Sybase).

The incumbent will report to the Head of Software Development and in turn to the Deputy Director of the Division of the Controller and Management Services.

Minimum Requirements: University degree in Computer Science, Statistics, Economics, Mathematics or other relevant discipline, with a minimum of 12 years professional EDP experience, of which at least 6 years must be at the Project Leader level. Considerable experience at an increasing level of responsibility in the field of system innovation can substitute for a formal degree.

Languages: Fluency in English and working knowledge of French is essential. Knowledge of other languages an advantage. UNHCR offers competitive international salaries, benefits and allowances.

APPLICATIONS: Full curriculum vitae, including salary history, nationality and references should be sent to the Chief, Recruitment and Career Management Section (ref. GP), UNHCR, Case Postal 2500, 1211 Geneva 2 Deposit, Switzerland. Fax. No. (+41) 22 739-7312. Applications must be received by 9 August 1996.

UNHCR encourages qualified women to apply. Because of the number of applications expected, acknowledgments will only be sent to short-listed candidates under serious consideration.

ATTENTION I.S. PROFESSIONALS!

Add your resume information to the Discovery Database and let all the consulting companies that are looking for your skills come to you. No commitment and no positions are guaranteed. No obligation to accept any offers. And it costs you absolutely nothing if you want the added advantage, mail or fax your resume to:

Computerworld's 1995-96 Salary Survey is Now Available on Disk!

What are other IT managers paying their staff?

Are you offering competitive rates?

Which industries are paying top dollar?

Answers to these and many more questions are found in Computerworld's 9th Annual Salary Survey on disk. For all the latest software and hardware positions it's covered in 21 industries.

Need! The Disk also includes Compensation by Title, Computerworld's 100 Best Places to Work and the 100 Best Companies to Work For. All the latest software and hardware positions it's covered in 21 industries.

Find out what the latest IT managers are willing to pay for talent. Which skills are in highest demand? Which industries are willing to pay two dollar more for a particular skill? What technology skills listed which include development skills, system management, system monitoring and interconnecting equipment, DB2/MFC and more. All the latest software and hardware positions it's covered in 21 industries.

Industries add in 22 industries—plus one.

All this for just \$29.

The Power Tool of Direct Marketing

Card Deck Advertising

Today, direct response card decks are one of the most powerful and cost-effective ways to reach a group of potential buyers. Card decks bundle together product and service offers and are mailed directly to the desks of a highly-qualified target audience. The cards are presented in a postage-paid business reply card format so easy to respond to that they practically demand response!

Computerworld Card Decks are the perfect example of the success you can have generating leads and making sales by using card decks. Just look at what our advertisers have to say:

Immediately Profitable

"I've been truly amazed at our response rate. Being a small and relatively young company we need fast punches that are immediately profitable. That's exactly what Computerworld Card Decks deliver."

Scott C. Avera
Vice President/General Manager
Ascent Solutions, Inc.

High - Quality Leads

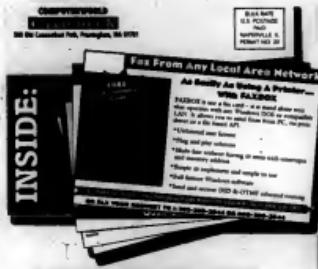

"Bottom line, for generating high-quality leads that we consistently turn into sales, Computerworld Card Decks are unequalled as an advertising medium."

Andrew Blencowe
President & CEO
Argent Software, Inc.

Quality Leads in Volume

"I used to be a bit skeptical of the potential value of card deck advertising. However, after running my first ad in the Computerworld Card Deck, I quickly discovered that a lot of people do look at card decks. In fact, I was shocked by the volume of responses when the first box was delivered. The vast majority were from professionals with a sincere interest in my product."

Russ Teubner
President
Teubner & Associates

#1 in Quantity & Quality

"In computer trade press advertising, Computerworld Card Decks are first in quantity and quality - and lowest in cost per qualified lead."

Charles A. Mills
President
Fresen Computer Co.

Targeted Reach

"Targeted reach, low cost/high value, and unmatched pulling power automatically place Computerworld Card Decks at the top of our advertising schedule for 1996."

Tammy Logan
Card Deck Marketing
American International Facsimile Products (AIFP)

Cost-Effective

"With their excellent cost-per-lead, Computerworld Card Decks consistently generate the highest profits of any deck we've tried. Every time we advertise we receive well over 100 leads. Sometimes we even get responses six months later."

Mary Cooper
Vice President
cSoftwares, Inc.

Sales Success

"Month after month, quality leads and sales success show us that Computerworld Direct Response Cards are one of the most effective ways to reach more of our potential audience - faster and easier."

David Kimball
President
Telesparmer International

Best Lead Source

"In our multi-level advertising approach, card decks traditionally rank among our best lead sources. In fact, we average upwards to 750 responses for each Computerworld Direct Response Card we run."

Marty Murphy
President
Faulkner Information Services

Computerworld Card Decks give you a cost-effective way to reach Computerworld's powerful buying audience of over 143,000 computer professionals. Every month. They're working for these advertisers - and they can work for you!

To reserve your space, call Norma Tamburrino, National Accounts Director, at 800-252-4821, ext. 500 - today!

Marketplace

Through heat, dirt and spilled coffee... rugged notebooks DELIVER

By Lynn Haber

PREPARE FOR THE WORST. That's the credo of users whose work environments are just too demanding for most off-the-shelf notebook computers.

When shopping for ruggedized portable devices, these users first consider what the products must endure: heat, cold, moisture, vibration, shock, electromagnetic interference and air contaminants such as dirt, dust and grime.

A handful of vendors caters to the niche market of rugged notebook computers: Amrel Technology, Inc. in Arcadia, Calif.; Badger Computers in Tampa, Fla.; Deltach Computer Systems in Fremont, Calif.; Fieldworks, Inc. in Edina, Minn.; Husky Computers, Inc. in Clearwater, Fla.; Itronix in Spokane, Wash., and RDI Computer Corp. in Carlsbad, Calif. Those manufacturers cater to users in industries such as aerospace, chemicals, manufacturing, marine, medical, military, petroleum and transportation.

Heavy use
Rugged notebook manufacturers like to differentiate their products from traditional notebooks according to their usage, which puts many more duty cycles on a machine. Their computers tend to be used all day, every day — picked up, put down, tooted in vehicles and so on.

Sears Home Services, a division of Sears, Roebuck and Co. in Hoffman Estates, Ill., is rolling out 12,000 rugged notebook computers to field service technicians nationwide.

"For our workers, a notebook computer is a tool, not a fashion accessory," says Lawrence Flinney, senior systems director.

Flinney's primary criterion for a notebook computer was an ability to withstand being carried in a truck or on city streets in a range of temperatures from -40 degrees Fahrenheit in Minnesota to a sweltering 100-plus degrees F in the South.

"Under these circumstances, you deal with high vibration and the notebook has to be ruggedized," Flinney says.

Vendors such as Itronix, for example, seal all ports as well as the case because condensation and other contaminants can cause a circuit to short or a board to fail.

Temperature fluctuations also have a big impact on the performance of the screen, or monitor. At above 115 degrees F, the material in an LCD screen turns black. At temperatures closer to 180 degrees F to 190 degrees F, the screen can be damaged. Traveling down the thermometer, the screen dims and works slower below 32 degrees F because the liquid in the screen freezes. At -30 degrees F to -40 degrees F, permanent damage can occur.

Damage to the notebook computer as a

result of being dropped was the primary concern at Northwest Airlines, Inc. when officials decided to purchase a diagnostic and troubleshooting software application for the company's aircraft mechanics. "We knew from the start that we needed a rugged portable notebook computer," says Mark W. Lowry, senior business analyst in the technical operations, automation and technology management group at Northwest in Minneapolis.

Northwest is leasing the Boeing Co. software on its 747 Model 400 airplanes and has deployed two rugged notebook computers. The mobile units, which are carried in to the aircraft's cockpit, were designed to

read faults off the airplane's computers. The notebooks can access maintenance manuals, a fault isolation manual, an illustrated parts catalog and other information via CD-ROM. Mechanics have a wealth of data at their fingertips, and they can order parts and get the aircraft repaired faster.

Another concern for Lowry was the ability of the rugged notebook to run off aircraft power, which is 400Hz at 115V, not 60Hz, the normal power range. "A traditional notebook computer would fry in these conditions," he says. The Fieldworks rugged notebook features a universal adapter that suits the aircraft environment.

Rugged notebook computers were designed to be used in the field, but they're not as streamlined as their traditional notebook counterparts. "That's because the carrying case tends to be bigger and because the product is shock-mounted and rubberized," says Randal Giusto, manager of mobile computing research at International Data Corp. in Framingham, Mass.

Overall, the trend among rugged notebook computer vendors mirrors that of mainstream notebook vendors: faster processors, multimedia capability, wireless capability and modularity. ■

COMPUTERWORLD

Everything you need to know.

FOR EVERYONE WHO'S BEEN WAITING,
PATIENTLY FOR FASTER NETWORK STORAGE.

HOW DOES 50% FASTER SOUND? Probably like a dream for those seeking a smarter way to manage data. In that case, the Symbios Logic MetaStor SH4000 intelligent storage hub is a dream come true. It's a new storage system that attaches directly to your network and significantly increases throughput. Better still, it's from **METASTOR**™, Symbios Logic, a leader in storage technology.

The solution to managing data across large networks isn't as simple as adding disks or a new server, because general-purpose file servers aren't optimized for centralized storage. The MetaStor SH4000 intelligent storage hub is. It's all about I/Os and an astounding NPS Ops of 1,350. While storing up to 252 GB, it supports more users and reduces response time. It eliminates bottlenecks, automatically backs up and restores, conserves network resources and controls costs.

And the dream gets even better. Because the intelligent storage hub includes high-bandwidth RAID, an industry-leading 99.99% data availability, and an integrated five-DLT-drive tape array for 400% faster backup. And to meet future needs, it's designed for easy expansion.

So if you've been waiting for centralized storage with blazing I/Os, relax. The MetaStor SH4000 intelligent storage hub is here. To learn more, call Symbios Logic at 1-800-86-ARRAY, or visit our Web site at <http://www.symbios.com>.

The MetaStor intelligent storage hub attaches directly to your network, increasing data throughput by up to 50 percent.

Instant intranet. Just add Netra.

First it was the Internet, now it's the intranet. And everyone wants it built yesterday. You could try to throw together a bunch of hardware and software into a stopgap solution, or you could just unpack a Netra—the servers built specifically for the intranet. Pre-configured with Core 3.0 software to take advantage of the best Inernet technology, Netra servers are the ideal foundation on which to run all your critical business applications. They outperform the competition and give you power to spare on even the most demanding sites. Solstice™ FireWall-First™ security software and the Java™ Developers Kit make sure you're safe and ahead of the curve. And with Netscape™ Enterprise Server Software built in, it's little wonder Netra is the choice of intranet professionals everywhere. Perhaps that's why PC Magazine and LAN Magazine have piled on the awards. But then what else would you expect? After all, we're the intranet experts. To learn more about what Netra servers can do for you, contact <http://www.sun.com> or 1-800-786-0785, Ext. 385. **THE NETWORK IS THE COMPUTER™**

Playing the open market

You may dream of getting rich on stock options when your employer goes public, but be prepared for a little squeeze first

By Julie Bort

The initial public offering has created multitudes of millionaires — and a few billionaires — at companies such as Microsoft Corp. (Nasdaq:MSFT) and, more recently, Netscape Communications Corp. (Nasdaq:NSCP). Perhaps you dream of the same thing happening when your company takes the plunge into the public market.

But going public is not all sugar and stock options. The truth is that the IPO process for employees can be as stressful as it is promising. On the positive side, stock options take on a whole new meaning when a company goes public.

"The problem you have with private companies is that it's hard to know how much a stock is worth. With a publicly traded company that's trading on Nasdaq or the New York Stock Exchange every day at \$20 a share, you know its value," says Mark Shernas, a principal at Robertson, Stephens & Co., a San Francisco investment bank.

Stock options allow employees to purchase stock at a predetermined price.

During an IPO, that price is often the opening price. This can translate into big bucks if the stock hits a high.

On equal par with personal wealth, success on Wall Street can feel like a validation of your work, contends Brent Eich, author of *Netscape's JavaScript* and a veteran of IPOs at both Netscape and Silicon Graphics, Inc. (NYSE:SGI).

"There was a little more excitement to be here" during the early days of Netscape's IPO, Eich says. "I was working hard on Netscape 2.0, so my hours were heavy anyway. But suddenly, we were getting a lot more attention from outside the market, from the world."

On the other hand, going public can be stressful. From the moment a company decides to go public until 25 days after it starts trading — known as the quiet period — employees are forbidden to disclose anything that might influence how the stock might trade. It is also a time when management is preoccupied and frequently absent, and when lawyers, accountants and underwriters are combing through every aspect of the company's existence.

Such scrutiny leads some companies

to order "lack-lifes" in an attempt to improve the IPO outcome. This was the case for one high-tech start-up that is currently in its quiet period.

"We took a 7% pay cut," says one technical support manager at the company. "They also squeezed office space in half, so many people shared an office where before they had a single. It was an unpleasant time to be part of the company. A lot of people left when the squeeze was on. Since it is a rather small company, everyone feels the pain when an individual leaves. [But] we were promised profit sharing at the end of 1996. Well, see. If it happens, we could get double our 7% cut during the first quarter of 1997. I now have plenty of stock options. It appears the direction has focus now, and it's very exciting. I'm planning to stay."

Such lack-lifes are frowned upon by investment brokers.

"It's never a good idea to window-dress or do temporary measures to make the company look like it's ready to go public," says Doug Baird, principal of equity capital markets at Alex, Brown & Sons, Inc., an investment bank in Baltimore. "But there could be a lot of reasons for a company to specifically take an action like a pay cut. A lot of technology companies want to offer employees stock options, and there's a compensation expense associated with that."

Still, a majority of employees don't face these extremes. For many, an IPO is an exciting time in which their hard work is validated and rewarded.

Investor's bookshelf

Investing by the Stars: Using Astrology in the Financial Markets
By Henry Weingarten (McGraw-Hill, New York, 233 pages; \$24.95, hardcover)

Some people predict the stock market by the level of headlines or company activity, or why not take an astrological approach to the market? I tried to keep an open mind when reading this book, written by a former computer entrepreneur who now runs his own astrologically guided money management firm. The book opens with a somewhat convincing argument that astrology, when used in conjunction with traditional stock-picking methods such as technical evaluation and fundamental analysis, can be a useful tool for investors. But it quickly degenerates into an eccentric discussion of planetary patterns and stock market activity that challenges the attention span of anyone who isn't both an astrologer and a Wall Street analyst. What's the book's big prediction about the future of the stock market? That Wall Street will begin openly hiring financial astrologers. Don't hold your breath.

The Internet Report
By Mary Meeker and Chris DePuy (HarperBusiness, New York; 303 pages; \$20, paperback)

Having found yet another way to make money off the Internet craze, Morgan Stanley has published this collection of in-house research for the retail market. It includes chapters on features and use of the Internet and a chapter on software; a competitive analysis of some of the players; a glossary of Internet terms; and a list of cool sites. In an attempt to guide the wide range of readers that might pick this up in their neighborhood bookstore, the report offers a "trail map," similar to those used for hiking. The map recommends which chapters to read depending on your level of Internet savvy, novice, intermediate, expert and double diamond. The report gets a bit carried away with its own enthusiasm for the "Net," giving it a gloss toward the general public, a bigger dose of skepticism and a warning about the dangers of investing in Internet stocks seem warranted. Also, it is fast becoming outdated — having been published in April based on research completed in February. It is already more than two years old based on "Netscape years." — Tom Harbert

You Want A New Storage Controller To Put Mainframe

Mainframe
Open
Systems Party
With The
Storage Box

Each Other, Why Bother?

Only the revolutionary new Encore Infinity SP Family lets you configure mainframe class storage for simultaneous data sharing between mainframe, open systems, and PCs. Even better, while your different platforms can communicate at last, you control the conversation. You choose how much information is shared, how much is partitioned, who can access it, and how it's optimized for high performance, efficiency, and data protection. And if that's not enough, by using an Infinity SP storage solution you can do *all* of your system backups using the same centralized mainframe facilities you are already using. No other storage system offers you so much flexibility, with so much control of your company's information resources. Call 1-800-933-6267 to learn more about storage intelligent enough to enable all your systems to speak the same language. The first universal storage — now shipping and ready to install.

Industry Almanac

Blast from the past

Some companies, like some Top 40 pop stars, are one-hit wonders. They reach the top of the charts but can't seem to repeat that success. Then they fade into oblivion.

Such a fate would be ironic for Creative Technology Ltd. (Nasdaq:CREAF), a company that was instrumental in bringing music to PCs. The firm had a No. 1 smash with its SoundBlaster, a card that gives audio capabilities to PCs. But since the card was introduced in 1989, other companies have started to produce knockoffs. Recently, consumers have bypassed Creative Technology's quad-speed CD-ROM SoundBlaster package in favor of faster six- and eight-speed CD-ROM technology.

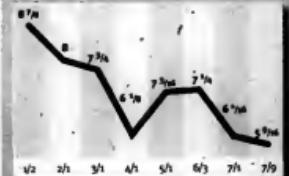

Creative Technology has tried to leverage the Blaster name with products such as PhoneBlaster and InternetBlaster. Neither product has lit up the charts, says Brian Eisenbarth, an analyst at Collins & Co. in Larkspur, Calif. But the company's new graphics accelerator, 3-D Blaster, holds some promise. "They have a solid distribution network, and vendors are developing new graphics products for [3-D Blaster]," Eisenbarth says. Collins & Co. rates the stock a hold.

Although Creative Technology has "good and innovative products," it has had difficulty bringing them to market, says J. D. Padgett, an analyst at Chatfield, Dean & Co. in Denver. He rates the stock "an uninspired hold" because of product delays that let competitors beat 3-D Blaster to market.

This Christmas season will be critical for Creative Technology, Padgett says. Strong sales of the 3-D Blaster could signal a comeback for the company. Poor sales will signal further financial deterioration. — *Stewart Deck*

Waiting for a blast

Success with its 3-D Blaster could boost Creative Technology's stock price, analysts say.

The company that defined the state-of-the-art in quad processing Pentium technology now takes the server world to the next level. Introducing the **ALR Revolution Quad6**, the first server to offer the power of four 166- or 200-MHz **Pentium Pro** chips. With its advanced processing,

PENTIUM PRO
PROCESSOR

integrated hardware management

features, and unequalled expandability, this amazing system is re-defining the PC server's role in today's business world.

Engineered specifically for 32-bit, SMP capable operating systems such as Windows® NT, Neware® SMP and SCO® UNIX, the ALR Revolution Quad6 offers superior server technology for transaction processing, inventory management, database queries, and other enterprise-wide applications. It supports four-way memory interleaving, giving this system a data bandwidth that rivals costly, proprietary, mainframe and minicomputer technology. Combine this wide data path with up to 2-GB of RAM, and you have the ideal solution for any business that needs to gather, analyze, and access massive amounts of data. And with its large, double-wide chassis, integrated security features, and available fault

With three available expansion slots, including PCI slots, the Revolution Quad6 offers a unique feature.

tolerant storage options, the Revolution Quad6 is also an ideal place to store this data.

Safe-guarding all this hardware is ALR's

new integrated Server Hardware Management system.

Utilizing an array of built-in sensors, ALR InfoManager monitors key environmental data such as processor temperature, fan operation, system voltage, and chassis security. This up-to-the-minute data is then relayed to a touch-screen LCD control panel, so operators can correct system problems before they lead to costly server downtime and component damage.

warranty next century.

The time for waiting is over. Superior server technology is here. To order your ALR Revolution Quad6, or for more in-depth information, contact your local ALR reseller. Or call our toll-free number today.

No wonder Windows NT Server

is the **fastest growing NOS**

Why so popular? It starts with the basics. You want compatibility? Windows NT Server runs on the same hardware as Windows 95. You want reliability? Windows NT Server has been in production for more than 10 years from the day it was first released. You want applications? Windows NT Server gives you all that and more. How? There are more applications being developed for Windows NT Server than for any one flavor of UNIX. (More than 2,400 applications are currently shipping on Windows NT Server, including SAP R/3 and PeopleSoft².) Flexibility? Windows NT Server supports the most hardware platforms—5,000 systems and counting. What's more, it's the only NOS with Internet support built-in, making it the Web platform more people prefer.³ (Critics also seem to prefer it, as awards like PC Week's Analyst's Choice, PC Magazine's Editor's Choice, and LAN Magazine's Product of the Year, will attest.) And support for Windows NT Server is exhaustive. More than 50,000 people trained on Windows NT Server this year alone. So see for yourself what all the flap is about. Call (800) 426-9400, Dept. A024. Or visit our Web site at www.microsoft.com/ntserver/.

Microsoft

WHERE DO YOU WANT TO GO TODAY?

Clash of the titans

CONTINUED FROM PAGE 1

— show Microsoft making surprising and dramatic inroads against Netscape in terms of the 1997 buying plans of corporate IS.

Netscape isn't "in trouble, but maybe it's coming to earth now that others in the market are waking up," said Jim Crapin, a senior software engineer at Ryder Information Systems, Inc., the Birmingham, Ala., IS group of rental company Ryder System, Inc.

Thirty percent of the 681 IS executives said they expect Microsoft to be their primary World Wide Web server vendor 12 months from now. Netscape loyalists numbered 23% — making it a virtual dead heat between the two rivals (see chart).

A similar survey on purchasing plans only three months earlier showed Netscape with a hefty 40% to 18% lead over Microsoft.

Netscape disagrees
Netscape officials disputed the survey results, saying their data draws a different picture.

The research "had nothing to do with market share or shipments," said Srivats Sampath, vice president of server market-

ing at Netscape.

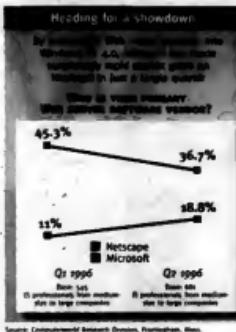

Furthermore, 92 of the 100 biggest U.S. companies run Netscape browsers, servers or both, he said.

Yet it wasn't any particular Netscape failing that cost it "cyber mind share" among survey respondents, said Rich Mikita, vice president of information management at Computerworld.

"Microsoft is a master at building excitement around its products. They probably have done that here," Mikita said. "In our first year of 15 mind-share tracking, the speed of Microsoft's gains are unprecedented for such a strategic product category."

Gigi Wang, senior vice president of communications research at International Data Corp. in Farnham, Mass., said "mind share" research is a valuable tool for indicating which companies are emerging market forces. "But mind share is anyone's game to win," she added. "It doesn't always translate into actual market share."

Among users interviewed about their plans to use Microsoft's Web products, the vendor's integration of its Internet Information Server (IIS) with the Win-

dows NT 4.0 operating system was a prime mover.

"If [IIS] comes with NT, we have to think, why not use it?" said Gary Stedman, a technology planning at Imperial Oil Ltd. Already a big Microsoft shop, the Calgary, Alberta, firm is testing IIS for intranet applications it plans to build this year.

Although freeware servers such as those from Apache and NCSA are widely used on the Internet, most corporate IS

shops prefer to deal with commercial vendors, said David Moschella, senior vice president of research at Computerworld.

"It looks like a two-way race between Microsoft and Netscape," he added. "No one else is even close." Microsoft may be building momentum, but it certainly doesn't have the Web server game sewn up, according to some users.

Not sold yet
Comerica, Inc., for example, will likely make Windows NT a corporate standard in the next year, but it isn't sold on Microsoft's IIS.

"Net technology is the standard for Web technology," said Victor Corrada, manager of technology planning at Comerica in Auburn Hills, Mich. "But that's a decision we have yet to make."

But for many, Microsoft's building arrangement can't be beat.

"Let's put it this way," said Kevin Scott, a senior programmer at Pechel Dodge Refining Corp. in El Paso, Texas. "If we're going to buy NT anyway, why spend extra to get Web software from another vendor?"

A ready answer to that question is critical to Netscape. If it doesn't want to be shamed into the Unix-only market, said Armen Bedrosian, a consultant at Trend Systems in Glendale, Calif.

Behind the scenes

Microsoft, which has been seen as a champion at the entertainment, food and publishing companies where he has helped build internal and external Web sites.

"It's a common sense that if you already use Microsoft operating systems, you use Microsoft Web software. If you use Unix, then Netscape would be the way to go," he explained.

But Netscape doesn't plan to concede the Windows NT market to Microsoft.

Roughly 80% of Netscape's \$234 million in server sales last year were on NT, and 40% were on Unix, Sampath said.

"We ship suites, not just Web servers, and we ship them for NT and Unix and will continue to do so," he said.

Paper glut

CONTINUED FROM PAGE 1

Many said their companies will spend money on workflow applications for the first time within the next two years. The combined market for workflow products and services is expected to reach \$3 billion by early next year, up from \$1.25 billion in 1994.

Just how much paper is still around is staggering. Emery said companies that gross more than \$1 billion in annual revenue process more than 88 million pages per year.

Even so, companies haven't given up on reducing how much paper they store — or at least on finding better ways to manage it.

Anita Ward, vice president and manager of the re-engineering program at Texas Commerce Bank in Houston, said the bank set out in 1994 to restructure the way it dealt with information. The amount of paper it has on hand is enormous — six miles of trust fund files stand out in Ward's mind.

The bank runs about 13 imaging and workflow applications, and several more are planned. Paper has been reduced, but more important, access to information is more readily available, Ward said.

Users are also turning to stored applications to fit their needs.

Jane Pugh, manager of IT at the Virginia Retirement System, which has more

she said. But the IBM imaging system the department installed wouldn't have met its needs without bringing in an IBM business partner to customize it, she said. The project, which began in 1991 and is now fully functional, cost about \$3 million. The AIM study noted that 44% of IT professionals surveyed cited ease of use and programming flexibility as predominant factors that influence their workflow purchases.

For Pugh's department, the ability to customize the software enables employees to store and audit trails and casefiled files to prioritize work.

"You have to understand what your users need because you can automate anything," Pugh said. "But if you can't give them what they need, you haven't accomplished anything."

What users most often look for is easier access to information and quick retrieval, said Carl Frapponi, a vice president at Delphi Consulting Group, Inc. in Boston. That can be accomplished most efficiently in an electronically managed environment, he said.

Randall Davis, a consultant for the international document management group

at pharmaceutical giant Glaxo Wellcome, Inc. in Research Triangle Park, N.C., said massive amounts of paper there have been reduced with imaging and workflow. But that wasn't the firm's first priority.

Glaxo uses workflow software in its regulatory affairs department to route Food and Drug Administration requests for information on drugs that have been proposed to the scores of employees who may have input into the responses. The company cut its response time from 10 days to two.

Not there yet

But, said Emery, even with advances in the electronic document management market, there is still a long way to go.

"You'll see less paper, but you won't see paperless," she said, pointing out that in spite of E-mail's paperless benefits, people still print out messages. And she says, electronic documents still mimic paper in form, style and content.

"When you go out onto the street and conduct business, a lot of what we get is still on paper, and people print it. So essentially we are getting more paperless, but we are creating many more information sources and therefore we have to have document management to navigate through that morass," Emery said.

A state agency uses imaging/workflow to save big bucks. See page 76.

than 300,000 members, said her department used imaging and workflow to change the way it conducted business, eliminating reams of paper in the process.

"We held tremendous amounts of paper coming in and few people to process it,"

Inside Lines

HP's poster children

Save for attention from Hewlett-Packard, HP 3000 users will try to unfurl a world-record-size poster during next month's HP World '96 conference in Anaheim, Calif. The poster will cover two-thirds or more of a local football field and feature the elegant phrase, "MPE Users Kick Butt." MPE is the HP 3000 operating system. But there are a few issues to contend with, according to a Usenet newsgroup posting. Even a slight wind has sent test posters flying; a field trial showed it would take four days to assemble the poster rather than the allotted four hours, and everything has to be wrapped up by 4 p.m. on D-Day because a youth football team needs the field for practice.

Microsoft finds synonyms for 'oops'

Microsoft recently apologized to users of the Spanish-language version of Word 6.0 for dubious dictions in the software's thesaurus. Several offensive options appear when searching for synonyms. These include "savage" and "man-eater" for the word "Indian"; "vicious" and "inverted" for "homosexual"; "pervert" and "depraved person" for "lesbian"; and "Aryan," "white" and "civilized" for "Western." Microsoft hopes to provide a revised version for free via the Internet next month.

Cisco boosts ATM viability

Fresh off final approval of its \$4 billion merger with StrataCom, Cisco is working on a technology it developed by StrataCom aimed at making the leap to wide-area ATM services easier for users. The technology, called Internet ATM Multiplexing, aggregates multiple T1 lines so users don't have to move all the way up to T3 lines. Cisco/StrataCom will ship the first product this week and will add the technology to Cisco routers and switches where appropriate.

IBM brews mainframe 'lite'

In an effort to lure more software vendors to mainframes, IBM later this year will offer software that makes big iron look more like Unix. Called "MVS Lite," the package lets application makers bring up System/390 functions through a Unix shell so developers "don't need to know about MVS," said Charles Lickel, IBM's vice president of System/390 software development. "We're using this as a first learning experience ... and reducing the amount of skill needed by users" new to mainframes, Lickel said.

DEC to launch FX32

Digital is getting ready to announce its FX32 translation software for Alpha chips sometime later this month or early next month. The much-awaited software gives Alpha users transparent access to 32-bit X86 applications, including Windows 95. According to a Digital source, initially FX32 will allow Alpha chips to run 32-bit X86 applications at greater than 70% of native performance. The product is currently in beta testing with Windows NT 4.0 and will ship concurrently with the operating system.

On July 3, the aliens attack. On July 4, we fight back. On July 11, Independence Day's special effects film credits its network. Pacific Ocean Point, the postproduction firm that handled 200 visual effects shots for the box office blockbuster Independence Day said its work was made possible with a fiber-optic network from Ameri Communications. The fiber network, which features high-performance switching and lightweight image transmission, replaced Pacific Ocean Point's Ethernet network. It handles a maximum volume of the 12.8 bytes of data required for the total 350 special effects in the movie. If you have any special effects you'd like to share, contact news editor Patricia Keefe at (508) 820-6183 or via E-mail at patricia_keefe@pac.com.

Calling Dick Tracy! Times in Middlebury, Conn., has expanded the Time on Data Link Watch, which automatically logs telephone download info—e-mail, fax, or telephone numbers and options—into a PC. The latest version provides more memory and lets the watch download 500 e-mail messages at a 64-kilobit rate. The watch costs \$139 and includes the PC software.

Digital Frontiers

The World Wide Web offers an effective way for political candidates to reach active voters, according to Jim Pilkow, a researcher at the Georgia Institute of Technology in Atlanta.

More than 90% of the Web users who responded to an online survey said they were registered voters, and 63% said they voted in the most recent elections. Those proportions are higher than those for the U.S. population at large.

Moreover, 35% of the Web surfers said they voted to elected officials, and 22% said they had signed petitions. "These numbers suggest that the Web can potentially play a significant role in politics," Pilkow said.

IBM presents the first affordable 25Mbps ATM Workgroup Solution. Everyone is talking about ATM as the answer for speeding up busy networks. But there are two good reasons why business hasn't stampeded en masse to the ATM solution: It costs a lot. And to get there, you have to rip out everything you have.

Well, with all respect to the status quo, IBM now unveils the new 25Mbps ATM Workgroup Solution. It comes complete with workstation adapters, giving you an immediate boost in bandwidth, with plenty of room to grow in the future. And it all comes at the refreshingly low price of \$495 per connection.

So why just dream about getting an affordable ATM solution when you can install one today? See your nearest IBM reseller or call us at 1 800 IBM-2468, ext. DA130, to learn more. Or, if you prefer, you can visit our Web site at www.raleigh.ibm.com/netad.html for all of the details. We have lots of information to share. And the good news is, we can get it to you fast.

IBM

Solutions for a small planet™

Land The 10 Or 100 Mbps Performance
Your Ethernet Network Needs.

Bay Networks offers a full line of high-performance Ethernet products from desktop to backbone.

A server bottleneck. Desktop congestion. Your network is starving for more bandwidth. Fortunately, we've got the high-performance solutions you need.

Only Bay Networks has a full range of products to increase Ethernet network performance end-to-end. And only Bay Networks lets you choose exactly where to deploy 10 or 100 Mbps. Shared or switched. While still leveraging your current investment in 10BASE-T.

Plus, with our Optivity® network management system, you can easily monitor and control your entire network. The result is a complete solution that can satisfy your network now and in the future.

So call 1-800-8-BAYNET ext. 162 to get our High-Performance Ethernet Deployment report. And see how Bay Networks can get your Ethernet performance jumping.

Optivity®. The leading network management solution.

EtherExpress™ Adapter. Promise kept on Fast Ethernet.

BayStack™ 100BASE-T Hub. More bandwidth to servers and workstations.

BayStack™ Ethernet Workgroup Switch. Boost 10BASE-T performance.

BaySwitch™ 10000 Giga Switch. 10 or 100 Mbps switching on any port.

Access Stack Node and Backbone Node routers. High-speed network layer aggregation.
